Large Space Structures: Dynamics and Control S.N. Atluri, A.K. Amos, 2012-12-06 This monograph is intended to provide a snapshot of the status and opportunities for advancement in the technologies of dynamics and control of large flexible spacecraft structures It is a reflection of the serious dialog and assessments going on all over the world across a wide variety of scientific and technical disciplines as we contemplate the next major milestone in mankind's romance with space the transition from exploration and experimentation to commercial and defense exploitation This exploitation is already in full swing in the space communications area Both military and civilian objectives are being pursued with increasingly more sophisticated systems such as large antenna reflectors with active shape control Both the NATO and Warsaw pact alliances are pursuing permanent space stations in orbit large structural systems whose development calls for in situ fabrication and or assembly and whose operation will demand innovations in controls technology The last ten years have witnessed a fairly brisk research activity in the dynamics and control of large space structures in order to establish a technology base for the development of advanced spacecraft systems envisioned for the future They have spanned a wide spectrum of activity from fundamental methods development to systems concept studies and laboratory experimentation and demonstrations Some flight experiments have also been conducted for

various purposes such as the characterization of the space environment durability of materials and devices in that environment assembly and repair operations and the dynamic behavior of flexible structures It is this last area that has prompted this monogram

Advances in Geometric Programming Mordecai Avriel, 2013-03-09 In 1961 C Zener then Director of Science at Westinghouse Corporation and a member of the U S National Academy of Sciences who has made important contributions to physics and engineering published a short article in the Proceedings of the National Academy of Sciences entitled A Mathematical Aid in Optimizing Engineering Design In this article Zener considered the problem of finding an optimal engineering design that can often be expressed as the problem of minimizing a numerical cost function termed a generalized polynomial consisting of a sum of terms where each term is a product of a positive constant and the design variables raised to arbitrary powers He observed that if the number of terms exceeds the number of variables by one the optimal values of the design variables can be easily found by solving a set of linear equations Furthermore certain invariances of the relative contribution of each term to the total cost can be deduced The mathematical intricacies in Zener's method soon raised the curiosity of R J Duffin the distinguished mathematician from Carnegie Mellon University who joined forces with Zener in laying the rigorous mathematical foundations of optimizing generalized polynomials Interestingly the investigation of optimality conditions and properties of the optimal solutions in such problems were carried out by Duffin and Zener with the aid of inequalities rather than the more common approach of the Kuhn Tucker theory
