Farooqui, 2012-07-10

Phytochemicals, Signal Transduction, and Neurological Disorders Phytochemicals are a heterogeneous group of bioactive compounds produced by plants which are extensively researched by scientists for their health promoting potentials in human diseases. Unlike vitamins and minerals, phytochemicals are not required for sustaining cell viability but they play an important role in protecting tissues and cells from the harmful effects of oxidative stress and inflammation. Examples of phytochemicals include catechins, resveratrol, ginkgo biloba, curcumin and sulfur compounds found in garlic. Although the precise molecular mechanisms associated with beneficial effects of phytochemicals still remain the subject of intense investigations, but it is becoming increasingly evident that phytochemicals mediate their effects by counteracting, reducing and repairing the damage caused by oxidative stress and neuroinflammation. In addition, phytochemicals also stimulate the synthesis of adaptive enzymes and proteins through the stimulation of a transcription factor called Nrf2 and induction of phase II detoxifying enzymes. Consumption of phytochemicals induces a neurohormetic response that results in the expression of adaptive stress resistance genes that are responsible for encoding antioxidant enzymes, protein chaperones and neurotrophic factor BDNF. Based on the stimulation of signal transduction network and adaptive stress resistance genes, it is proposed that the use of phytochemicals from childhood to old age along with regular exercise is an important strategy for maintaining normal aging and delaying onset of age related neurological disorders, stroke, Alzheimer disease and Parkinson disease. Phytochemicals, Signal Transduction, and Neurological Disorders presents readers with cutting edge and comprehensive information not only on bioavailability and mechanism of action of phytochemicals in the brain but also provides the molecular mechanism associated with beneficial effects of phytochemicals in neurotraumatic stroke, spinal cord trauma and traumatic brain injury and neurodegenerative Alzheimer's disease, Parkinson disease, Huntington disease and amyotrophic lateral sclerosis diseases. Inflammation and Oxidative Stress in Neurological Disorders Akhlaq A. Farooqui, 2014-01-27

Farooqui, Wei-Yi Ong, Lloyd A. Horrocks, 2007-11-20 In the past decade our understanding of the biochemistry molecular biology and neuropathology of the glutamate transporters and receptors has exploded It is becoming increasingly evident that molecular mechanisms which govern the transfer of the death signal from the neural cell surface to the nucleus depend on lipid mediators and on cross talk among excitotoxicity oxidative stress and neuroinflammation and that interactions among these three processes play a major role in neuronal cell death during acute neural trauma and neurodegenerative disease These processes may be primary initiating points in neurodegeneration or they may be the end result of the neurodegenerative process itself *Neurochemical Aspects of Excitotoxicity* provides extensive insight into glutamate transporters and receptors including their role in the brain with other neurochemical parameters in excitotoxicity and possible treatments This book will be of interest scientists already working in the field of excitotoxicity who are interested in gaining a broader understanding of this complicated subject area as well as graduate students and neurologists who are curious about a common cause of neuronal injury and neurological disorders
