Liquid Chromatography Chapter 10 Solvent Selection In Liquid Chromatography:

Liquid Chromatography G. Ramis-Ramos, M.C. García-Álvarez-Coque, 2013-01-08 Many solvents can be used to prepare mobile phases in liquid chromatography. Also mixtures of solvents at different ratios are used to modify the mobile phase properties. This can make solvent selection for method development a hard task unless suitable guidelines are followed. This chapter summarizes the most common strategies used by skilled chromatographers in reversed phase, normal phase and hydrophilic interaction liquid chromatography. These are based on considerations about the global polarity of solutes, stationary phase and mobile phase which determine the elution strength and on the particular profile of the contributions of intermolecular interactions to the global polarity which determines the selectivity. The optimization of selectivity using isoelectrostatic mixtures on the rational basis provided by solvent selectivity triangles and systematic trial and error procedures in the isocratic and gradient elution modes is described. Additional considerations for mobile phase selection including computer assisted interpretive optimization, sustainability criteria and the use of high temperatures are also commented.

Retention and Selectivity in Liquid Chromatography R.M. Smith, 1995-01-13. This book brings together a number of studies which examine the ways in which the retention and selectivity of separations in high performance liquid chromatography are dependent on the chemical structure of the analytes and the properties of the stationary and mobile phases. Although previous authors have described the optimisation of separations by alteration of the mobile phase, little emphasis has previously been reported of the influence of the structure and properties of the analyte. The initial chapters describe methods based on retention index, group increments, and log P increments for the prediction of the retention of analytes and the ways in which these factors are influenced by mobile phases and intramolecular interactions. The values of a wide range of group increments in different eluents are tabulated. Different scales of retention indices in liquid chromatography are described for the comparison of separations, the identification of analytes, and the comparison of stationary phases. Applications of these methods in the pharmaceutical, toxicology, forensic, metabolism, environmental, food, and other fields are reviewed. The effects of different mobile phases on the selectivity of the retention indices are reported. A compilation of sources of reported retention index values are given. Methods for the comparison of stationary phases based on the interactions of different analytes are covered, including lipophilic and polar indices, shape selectivity, comparisons, their application to novel stationary phases, and chemometric methods for column comparisons.

High Performance Liquid Chromatography Heinz Engelhardt, 2012-12-06 Modern liquid column chromatography LC has developed rapidly since 1969 to become a standard method of separation If the statisticians are to be believed the recent growth of LC has been the most spectacular development in analytical chemistry and has not yet abated because its vast potential for application remains to be fully exploited Significant factors contributing to this continued rise are the simplicity and low cost of the required basic equipment and the relative ease of acquiring and interpreting the data Unfortunately in LC as so often in the field of analytical chemistry the available commercial instruments are frequently far more complicated and consequently far more expensive than is necessary for routine application Therein also lies the risk of propagating a black box philosophy that would be particularly detrimental to chromatography Moreover it appears to have been forgotten as was done previously with gas chromatography that inadequate separation by a column can be remedied only with great difficulty if at all by electronic means Also whether the capillary columns recently advocated with great enthusiasm for LC will fulfill the expectations of their proponents is highly questionable unless someone comes up with some new and revolutionary ideas
