Chemical Bonds and Electronegativity

Electronegativity is an atom's ability to attract electrons. Elements with low electronegativity have outer shells that are almost empty and tend to gain or lose electrons easily. Elements with high electronegativity have outer shells that are nearly full and tend to hold on to their electrons. Ionic bonds form when the electronegativity of two atoms differs significantly, and covalent bonds form when electronegativity of the atoms are more similar. Typically, the greater the difference in electronegativity, the more ionic the bond. The greater the similarity, the more covalent the bond.

Electronegativity increases from bottom left to top right of the periodic table.

Diagram A: Which atom has a higher electronegativity?
