

1. The **glucose** created through **photosynthesis** is used to provide energy needed by the plants to perform **life functions** such as **growing** and **repairing**.
2. To obtain the energy from the food it produces, plants must break down the **sugar** in the cells throughout the plant in a cellular process called **respiration**.
3. Cells require **glucose** and **oxygen** gas to undergo **respiration**.
4. **Oxygen** gas from the air (taken in through the **stomata**) combines with the **glucose**, which is then broken down producing **carbon dioxide** and **water**.
5. During the process **energy** is released. This energy will be used by the plant to perform life functions such as **growth** and **repair**.
6. The **carbon dioxide** gas and **water** that are formed are then given off through the **stomata** in the **leaves**.

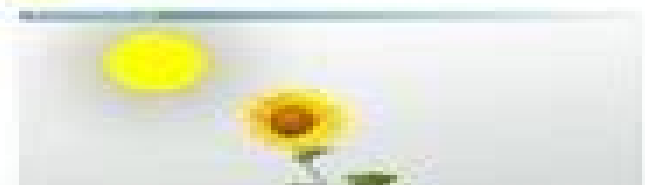

Transpiration:

1. Some of the water taken in through the **roots** of plants is used in the process of **photosynthesis**.
2. Plants store **water** inside the cells.
3. Plants lose **water** through the **leaves**. This process is called **transpiration**.
4. Without a way to control **transpiration**, plants would wither up and die.
5. **Guard** cells, mostly on the underside of the leaf, open and close the **stomata** and allow plants to control **transpiration**.
6. When the **stomata** are closed, water cannot escape from the **leaf**.

Tropisms:

1. **Phototropism** is the way a plant grows or moves in response to light.
