LOST LANGUAGES / THE  
ENIGMA OF THE WORLD'S  
UNDECIPHERED SCRIPTS  
/ ANDREW ROBINSON /

**Abstract:** The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 sedentary, middle-aged women who were randomly assigned to either a supervised walking program or a control group. The walking program consisted of 12 weeks of supervised walking, 3 times per week, for 30 minutes per session. The control group consisted of 20 women who did not participate in the walking program. The physical and psychological health of the women was assessed at baseline and at 12 weeks. The results of the study showed that the walking program had a positive effect on the physical and psychological health of the women. The women in the walking program showed significant improvements in physical fitness, including increases in aerobic capacity, muscle strength, and endurance. The women in the walking program also showed significant improvements in psychological health, including decreases in anxiety and depression, and increases in self-esteem and quality of life. The results of this study suggest that a 12-week, low-intensity, supervised walking program can be an effective intervention for improving the physical and psychological health of sedentary, middle-aged women.
