Salinity Responses and Tolerance in Plants, Volume 2 Vinay Kumar, Shabir Hussain Wani, Penna Suprasanna, Lam-Son Phan Tran, 2018-06-22 Soil salinity is a key abiotic stress and poses serious threats to crop yields and quality of produce Owing to the underlying complexity conventional breeding programs have met with limited success Even genetic engineering approaches via transferring overexpressing a single direct action gene per event did not yield optimal results Nevertheless the biotechnological advents in last decade coupled with the availability of genomic sequences of major crops and model plants have opened new vistas for understanding salinity responses and improving salinity tolerance in important glycophytic crops Our goal is to summarize these findings for those who wish to understand and target the molecular mechanisms for producing salt tolerant and high yielding crops Through this 2 volume book series we critically assess the potential venues for imparting salt stress tolerance to major crops in the post genomic era Accordingly perspectives on improving crop salinity tolerance by targeting the sensory ion transport and signaling mechanisms were presented in Volume 1 Volume 2 now focuses on the potency of post genomic era tools that include RNAi genomic intervention genome editing and systems biology approaches for producing salt tolerant crops

Perspectives on the Gastrointestinal Microbiota of Small Ruminants Anusorn Cherdthong,Einar Vargas-Bello-Pérez,Qing Zhang,Eric Altermann,Anil Kumar Puniya ,Raffaella Tudisco,2024-09-23 Ruminants are hoofed mammals with a unique digestive system that allows them to better create energy from fibrous plant material than other herbivores Small ruminants such as sheep and goats play an important role in global food security and nutrition as well as in the livelihoods of farmers and others along the food chain Due to the unique digestive systems of ruminants many major studies have focused on the effects of high concentrate diets on rumen fermentation ruminal acidosis and their microbial properties and functions Therefore paying attention to the intestinal health of small ruminants during the rapid fattening stage has important implications for their health and productivity Ruminants host a taxonomically diverse microbiota in their

rumen which is generally considered to be the most efficient natural fermentation system Rumen microorganisms facilitate the degradation of otherwise indigestible plant fibres into absorbable compounds such as proteins and volatile fatty acids the main source of energy and nutrition for ruminants They are composed of a complex and dynamic assembly of bacteria fungi archaea protozoa and viruses Diets and additives directly affect the number and viability of rumen microorganisms

Animal Welfare in Extensive Production Systems Juan Villalba,Xavier Manteca,2016-07-29 There has been a lot written about animal welfare in intensive farming systems but very little about animals reared in extensive agricultural systems Yet these animals make up a significant proportion of the world s farm animal population covering a large portion of the globe Animals kept in extensive conditions face a unique set of challenges that are vital for anyone with an interest in farm animal welfare to understand *Animal Welfare in Extensive Production Systems* presents those challenges in a practical way backed up with thoroughly referenced research Topics covered include heat stress water quality and availability nutrition predation poisonous plants transport human animal interactions and neonatal mortality This book is ideal for animal welfare academics students and researchers It can also be beneficial to students in animal science veterinary science and agriculture and to farm industry producers and personnel The *Animal Welfare Series* covers current topics in animal welfare to further research and inform the scientific policy making and farming communities 5m Books *Bibliography of*

Halophytes as a resource for livestock and for rehabilitation of degraded lands V. Squires,A.T. Ayoub,2012-12-06 Desertification land degradation in arid semi arid and dry sub humid areas resulting mainly from adverse human impacts is the main environmental problem of dry lands which occupy more than 40 per cent of the total global land area The phenomenon threatens about 3 6 billion hectares and currently affects the livelihood of about 900 million people Thl world is now losing annually about 1 5 million hectares of total irrigated lands 240 million hectares due mostly to salinization mainly in drylands Salt affected soils are widely distributed throughout the arid and semi arid regions and particularly severe in China 7 million ha India 20 million ha Pakistan 3 2 million ha USA 5 2 million ha as well as Near East southern Europe and elsewhere Demands on production have increased the pressure on existing productive land and moved the limits of production onto increasingly marginal lands Wise land use practices have yet to be developed for such conditions The Executive Director of

UNEP reported to the Governing Council in February 1992 concerning the Status of Desertification and Implementation of the United Nations Plan of Action to Combat Desertification (PACD). The Report concludes that major efforts to implement the PACD had gone into supporting measures rather than concrete corrective field operations. Little evidence of progress was found in irrigated croplands, rainfed croplands or rangelands. It was recommended that every piece of land should be used in keeping with its ecological characteristics, natural capabilities and constraints.
