Pore Scale Geochemical Processes Carl Steefel,Simon Emmanuel,Lawrence Anovitz,2015-09-25 This RiMG Reviews in Mineralogy Geochemistry volume includes contributions that review experimental characterization and modeling advances in our understanding of pore scale geochemical processes The volume had its origins in a special theme session at the 2015 Goldschmidt Conference in Prague From a diversity of pore scale topics that ranged from multi scale characterization to modeling this work summarizes the state of the science in this subject Topics include modification of thermodynamics and kinetics in small pores chemo mechanical processes and how they affect porosity evolution in geological media small angle neutron scattering SANS techniques how isotopic gradients across fluid mineral boundaries can develop and how these provide insight into pore scale processes Information on an important class of models referred to as pore network and much more The material in this book is accessible for graduate students researchers and professionals in the earth material environmental hydrological and biological sciences The pore scale is readily recognizable to geochemists and yet in the past it has not received a great deal of attention as a distinct scale or environment that is associated with its own set of questions and challenges Is the pore scale merely an environment in which smaller scale molecular processes aggregate or are there emergent phenomena unique to this scale Is it simply a finer grained version of the continuum scale that is addressed in larger scale models and interpretations The scale is important because it accounts for the pore architecture within which

such diverse processes as multi mineral reaction networks microbial community interaction and transport play out giving rise to new geochemical behavior that might not be understood or predicted by considering smaller or larger scales alone

Advances in the Characterization of Industrial Minerals G.E. Christidis, 2011-08-31 The advancement of human civilization has been intimately associated with the exploitation of raw materials In fact the distinction of the main historical eras is based on the type of raw materials used Hence passage from the Paleolithic and Neolithic Age to the Bronze Age is characterized by the introduction of basic metals mainly copper zinc and tin in human activities the Iron Age is marked by the use of iron as the predominant metal The use of metals has increased and culminated with the industrial revolution in the mid eighteenth century which marked the onset of the industrial age in the western world Since then the importance of metals has gradually been surpassed by industrial minerals in the industrialized countries Industrial minerals are raw materials used by industry for their physical and or chemical properties Characterization of industrial minerals is important for their assessment and can be demanding and often complicated This new volume co published by the European Mineralogical Union and the Mineralogical Society of Great Britain Ireland is based on papers presented at an EMU Erasmus IP School which was held in the Technical University of Crete Chania Greece The aim of the School was to describe advances in some of the analytical methods used to characterize industrial minerals and to propose additional methods which are currently not used for this purpose
