BoogarLists | Directory of IT Security Solutions, Managing Information Security Errin W. Fulp, 2013-08-21 The purpose of the firewall and its location is to have network connections traverse the firewall which can then stop any unauthorized packets. A simple firewall will filter packets based on IP addresses and ports. A useful analogy is filtering your postal mail based only on the information on the envelope. You typically accept any letter addressed to you and return any letter addressed to someone else. This act of filtering is essentially the same for firewalls. This chapter refers to the secure network as the internal network; the insecure network is the external network. The remainder of this chapter provides an overview of firewall policies, designs, features, and configurations. Of course, technology is always changing, and network firewalls are no exception. However, the intent of this chapter is to describe aspects of network firewalls that tend to endure over time

Managing Information Security James T. Harmening, 2013-08-21 Today when most companies and government agencies rely on computer networks to store and manage their organizations data it is essential that measures are put in place to

secure those networks and keep them functioning optimally Network administrators need to define their security management systems to cover all parts of their computer and network resources With a plethora of storage devices including iPads Android Tablets USB drives watches televisions Digital Video Recorders smart phones apple T V appliances Xbox s and household appliances the management becomes even more difficult This chapter focuses on security management systems Which are sets of policies put place by an organization to maintain the security of their computer and network resources These policies are based on the types of resources that need to be secured and they depend on the organization Some groups of policies can be applied to entire industries others are specific to an individual organization A security management system starts as a set of policies that dictate the way in which computer resources can be used The policies are then implemented by the organization s technical departments and enforced This can be easy for smaller organizations but can require a team for larger international organizations that have thousands of business processes Either way measures need to be put in place to prevent respond to and fix security issues that arise in an organization Standards that were in place ten years ago may not be adequate for current business practices As an example a strong password may have included less than 8 characters while modern computers can easily break the password utilizing brute force or rainbow table methods **Sustainable**
