

Baby Blue Whale

The largest baby animal in the world is the baby blue whale. A blue whale calf can weigh up to three tons when it is born. Whales are mammals. Like all mammals, the blue whale calf drinks its mother's milk. The milk is very rich in fat. In its first year, the baby blue whale grows 200 pounds a day. Wow!

When it is born, the mother blue whale pushes her calf to the ocean's surface for its first breath. Just like its mother, it needs to breathe air. Then every few minutes, it swims to the surface to breathe. At the surface, the calf breathes out. It blows misty air out through two blowholes on top of its head. The mist sprays high into the air! Then the calf takes in more air through its blowholes.

The whale calf starts to eat food when it is about six months old. Just like its mother, it eats tiny shrimp-like animals called krill. Blue whales have layers of baleen instead of teeth. Baleen is made of the same stuff as fingernails. It is like a big comb. The whale takes a huge gulp of ocean water. The baleen lets the water out, but not the krill.

Adult blue whales can be up to 100 feet long. That is about as long as three school buses! Adult blue whales are the largest animals in the world.
