Statistical Optics Joseph W. Goodman, 2015-05-06 This book discusses statistical methods that are useful for treating problems in modern optics and the application of these methods to solving a variety of such problems This book covers a variety of statistical problems in optics including both theory and applications The text covers the necessary background in statistics statistical properties of light waves of various types the theory of partial coherence and its applications imaging with partially coherent light atmospheric degradations of images and noise limitations in the detection of light New topics have been introduced in the second edition including Analysis of the Vander Pol oscillator model of laser light Coverage on coherence tomography and coherence multiplexing of fiber sensors An expansion of the chapter on imaging with partially coherent light including several new examples An expanded section on speckle and its properties New sections on the cross spectrum and bispectrum techniques for obtaining images free from atmospheric distortions A new section on imaging through atmospheric turbulence using coherent light The addition of the effects of read noise to the discussions of limitations encountered in detecting very weak optical signals A number of new problems and many new references have been added

Statistical Optics Second Edition is written for researchers and engineering students interested in optics physicists and chemists as well as graduate level courses in a University Engineering or Physics Department

Progress in Optics, 1994-11-16 This volume contains six review articles dealing with topics of current research interest in optics and in related fields The first article deals with the so called embedding method which has found useful applications in the study of wave propagation in random media The second article presents a review of an interesting class of non linear optical phenomena which have their origin in the dependence of the complex dielectric constant of some media on the light intensity These phenomena which include self focusing self trapping and self modulation have found many applications for example in fibre optics devices signal processing and computer technology The next article is concerned with gap solitons which are electromagnetic field structures which can exist in nonlinear media that have periodic variation in their linear optical properties with periodicities of the order of the wavelength of light Both qualitative and quantitative descriptions of gap solitons are presented and some experimental schemes for their detection in the laboratory are discussed The fourth article describes methods for the determination of optical phase from phase modulated images These methods have found applications in plasma diagnostics in connection with flow characterisation and in the design of new optical instruments The final article reviews developments relating to imaging through turbulence in the atmosphere It looks at the state of the art of our understanding of this subject and discusses the most important methods that are presently employed to compensate for image distortion caused by atmospheric turbulence

Diffraction-Limited Imaging with Very Large Telescopes D.M. Alloin, Jean-Marie Mariotti, 2012-12-06 A few years

ago a real break through happened in observational astronomy the understanding of the effect of atmospheric turbulence on the structure of stellar images and of ways to overcome this dramatic degradation This opened a route to diffraction limited observations with large telescopes in the optical domain Soon the first applications of this new technique led to some outstanding astrophysical results both at visible and infrared wavelengths Yet the potential of interferometric observations is not fully foreseeable as the first long baseline arrays of large optical telescopes are being built or commissioned right now In this respect a comparison with the evolution of radio astronomy is tempting From a situation where in spite of the construction of giant antennas low angular resolution was prevailing the introduction of long baseline and very long baseline interferometry and the rapid mastering of sophisticated image reconstruction techniques have brought on a nearly routine basis high dynamic range images with milliarcseconds resolution This of course has completely changed our views of the radio sky

Lightwave Communications George C. Papen, Richard E. Blahut, 2019-01-10 This pioneering course tested text is the first to combine communications theory with the physics of optical communications Comprehensive and rigorous it brings together an in depth treatment of the physical characteristics of the guided lightwave channel with the study of modern methods of algorithmic based communication in time and space The many different levels at which a lightwave communication signal can be described are integrated to provide a unified explanation of how a commonplace bit stream is transformed into a physical lightwave how that lightwave travels through an optical fiber and how it is then transformed back into the bit stream Background fundamentals such as linear systems and electromagnetics are explained in relation to modern topics such as channel models encoding modulation and interference and end of chapter problems are provided throughout This is an essential text for students taking courses on optical communications as well as researchers and professionals working in the area

Metamaterial Xun-Ya Jiang, 2012-05-16 In depth analysis of the theory, properties and description of the most potential technological applications of metamaterials for the realization of novel devices such as subwavelength lenses, invisibility cloaks, dipole and reflector antennas, high frequency telecommunications, new designs of bandpass filters, absorbers and concentrators of EM waves etc. In order to create a new device it is necessary to know the main electrodynamic characteristics of metamaterial structures on the basis of which the device is supposed to be created. The electromagnetic wave scattering surfaces built with metamaterials are primarily based on the ability of metamaterials to control the surrounding electromagnetic fields by varying their permeability and permittivity characteristics. The book covers some solutions for microwave wavelength scales as well as exploitation of nanoscale EM wavelength such as visible spectrum using recent advances of nanotechnology for instance in the field of nanowires, nanopolymers, carbon nanotubes and graphene. Metamaterial is suitable for scholars from extremely large scientific domain and therefore given to engineers, scientists, graduates and other interested professionals from photonics to nanoscience and from material science to antenna engineering as a comprehensive reference on this artificial materials of tomorrow.
