Mathematical Models Biology Bringing Mathematics:

Mathematical Models in Biology Valeria Zazzu, Maria Brigida Ferraro, Mario R. Guarracino, 2015-11-26 This book presents an exciting collection of contributions based on the workshop Bringing Maths to Life held October 27-29 2014 in Naples Italy. The state of the art research in biology and the statistical and analytical challenges facing huge masses of data collection are treated in this Work. Specific topics explored in depth surround the sessions and special invited sessions of the workshop and include genetic variability via differential expression, molecular dynamics and modeling complex biological systems viewed from quantitative models and microscopy images processing to name several. In depth discussions of the mathematical analysis required to extract insights from complex bodies of biological datasets to aid development in the field, novel algorithms, methods and software tools for genetic variability, molecular dynamics and complex biological systems are presented in this book. Researchers and graduate students in biology, life science and mathematics statistics will find the content useful as it addresses existing challenges in identifying the gaps between mathematical modeling and biological research. The shared solutions will aid and promote further collaboration between life sciences and mathematics.

Dynamics of Mathematical Models in Biology Alessandra Rogato, Valeria Zazzu, Mario Guarracino, 2016-11-03 This volume focuses on contributions from both the mathematics and life science community surrounding the concepts of time and dynamicity of nature, two significant elements which are often overlooked in modeling process to avoid exponential computations. The book is divided into three distinct parts: dynamics of genomes and genetic variation, dynamics of motifs and dynamics of biological networks. Chapters included in dynamics of genomes and genetic variation analyze the molecular mechanisms and evolutionary processes that shape the structure and function of genomes and those that govern genome dynamics. The dynamics of motifs portion of the volume provides an overview of current methods for motif searching in DNA, RNA and proteins, a key process to discover emergent properties of cells, tissues and organisms. The part devoted to the dynamics of biological networks covers networks aptly, discusses networks in complex biological functions and activities that interpret processes in cells. Moreover, chapters in this section examine several mathematical models and algorithms available for integration, analysis and characterization. Once life scientists began to produce experimental data at an unprecedented pace, it became clear that mathematical models were necessary to interpret data to structure information with the aim to unveil biological mechanisms, discover results and make predictions. The second annual Bringing Maths to Life workshop held in Naples Italy, October 2015, enabled a bi-directional flow of ideas from an international group of mathematicians and biologists. The venue allowed mathematicians to introduce novel algorithms, methods and software that may be useful to model aspects of life science and life scientists posed new challenges for mathematicians.
