Stochastic and Statistical Methods in Hydrology and Environmental Engineering Keith W. Hipel,2012-12-06 Objectives The current global environmental crisis has reinforced the need for developing flexible mathematical models to obtain a better understanding of environmental problems so that effective remedial action can be taken Because natural phenomena occurring in hydrology and environmental engineering usually behave in random and probabilistic fashions stochastic and statistical models have major roles to play in the protection and restoration of our natural environment Consequently the main objective of this edited volume is to present some of the most up to date and promising approaches to stochastic and statistical modelling especially with respect to groundwater and surface water applications Contents As shown in the Table of Contents the book is subdivided into the following main parts GENERAL ISSUES PART I PART II GROUNDWATER PART III SURFACE WATER PART IV STOCHASTIC OPTIMIZATION PART V MOMENT ANALYSIS PART VI OTHER TOPICS Part I raises some thought provoking issues about probabilistic modelling of

hydro logical and environmental systems The first two papers in Part I are in fact keynote papers delivered at an international environmetrics conference held at the University of Waterloo in June 1993 in honour of Professor T E Unny In his keynote pa per Dr S J Burges of the University of Washington places into perspective the historical and future roles of stochastic modelling in hydrology and environmental engineering Additionally Dr Burges stresses the need for developing a sound scien tific basis for the field of hydrology Professor P E

Numerical Analysis: A Graduate Course David E. Stewart, 2022-12-01 This book aims to introduce graduate students to the many applications of numerical computation explaining in detail both how and why the included methods work in practice The text addresses numerical analysis as a middle ground between practice and theory addressing both the abstract mathematical analysis and applied computation and programming models instrumental to the field While the text uses pseudocode Matlab and Julia codes are available online for students to use and to demonstrate implementation techniques The textbook also emphasizes multivariate problems alongside single variable problems and deals with topics in randomness including stochastic differential equations and randomized algorithms and topics in optimization and approximation relevant to machine learning Ultimately it seeks to clarify issues in numerical analysis in the context of applications and presenting accessible methods to students in mathematics and data science

Approximation and Complexity in Numerical Optimization Panos M. Pardalos, 2013-06-29 There has been much recent progress in approximation algorithms for nonconvex continuous and discrete problems from both a theoretical and a practical perspective In discrete or combinatorial optimization many approaches have been developed recently that link the discrete universe to the continuous universe through geomet ric analytic and algebraic techniques Such techniques include global optimization formulations semidefinite programming and spectral theory As a result new ap proximate algorithms have been discovered and many new computational approaches have been developed Similarly for many continuous nonconvex optimization prob lems new approximate algorithms have been developed based on semidefinite pro gramming and new randomization techniques On the other hand computational complexity originating from the interactions between computer science and numeri cal optimization is one of the major theories that have revolutionized the approach to solving optimization problems and to analyzing their intrinsic difficulty The main focus of complexity is the study of whether existing algorithms are efficient for the solution of problems and which problems are likely to be tractable The quest for developing efficient algorithms leads also to elegant general approaches for solving optimization problems and reveals surprising connections among problems and their solutions A conference on Approximation and Complexity in Numerical Optimization Con tinuous and Discrete

U.S. Government Research & Development Reports, 1966-11 **Advances in Geometric Programming** Mordecai Avriel, 2013-03-09 In 1961 C Zener then Director of Science at Westinghouse Corporation and a member of the U S National Academy of Sciences who has made important contributions to physics and engineering published a short article in the Proceedings of the National Academy of Sciences entitled A Mathematical Aid in Optimizing Engineering Design In this article Zener considered the problem of finding an optimal engineering design that can often be expressed as the problem of minimizing a numerical cost function termed a generalized polynomial consisting of a sum of terms where each term is a product of a positive constant and the design variables raised to arbitrary powers He observed that if the number of terms exceeds the number of variables by one the optimal values of the design variables can be easily found by solving a set of linear equations Furthermore certain invariances of the relative contribution of each term to the total cost can be deduced The mathematical intricacies in Zener's method soon raised the curiosity of R J Duffin the distinguished mathematician from Carnegie Mellon University who joined forces with Zener in laying the rigorous mathematical foundations of optimizing generalized polynomials Interestingly the investigation of optimality conditions and properties of the optimal solutions in such problems were carried out by Duffin and Zener with the aid of inequalities rather than the more common approach of the Kuhn Tucker theory Research and Technology Program Digest United States.
