Flow-Based Optimization of Products or Devices Nils Tångeford Basse,2020-11-13 Flow based optimization of products and devices is an immature field compared to the corresponding topology optimization based on solid mechanics However it is an essential part of component development with both internal and or external flow The aim of this book is two fold i to provide state of the art examples of flow based optimization and ii to present a review of topology optimization for fluid based problems **Computational Aerodynamic Modeling of Aerospace Vehicles** Mehdi Ghoreyshi,Karl

Jenkins,2019-03-08 Currently the use of computational fluid dynamics CFD solutions is considered as the state of the art in the modeling of unsteady nonlinear flow physics and offers an early and improved understanding of air vehicle aerodynamics and stability and control characteristics This Special Issue covers recent computational efforts on simulation of aerospace vehicles including fighter aircraft rotorcraft propeller driven vehicles unmanned vehicle projectiles and air drop configurations The complex flow physics of these configurations pose significant challenges in CFD modeling Some of these challenges include prediction of vortical flows and shock waves rapid maneuvering aircraft with fast moving control surfaces

and interactions between propellers and wing fluid and structure boundary layer and shock waves Additional topic of interest in this Special Issue is the use of CFD tools in aircraft design and flight mechanics The problem with these applications is the computational cost involved particularly if this is viewed as a brute force calculation of vehicle s aerodynamics through its flight envelope To make progress in routinely using of CFD in aircraft design methods based on sampling model updating and system identification should be considered

Using Noise to Characterize Vision Rémy Allard,Jocelyn Faubert,Denis G. Pelli,2016-03-02 Noise has been widely used to investigate the processing properties of various visual functions e g detection discrimination attention perceptual learning averaging crowding face recognition in various populations e g older adults amblyopes migrainers dyslexic children using noise along various dimensions e g pixel noise orientation jitter contrast jitter The reason to use external noise is generally not to characterize visual processing in external noise per se but rather to reveal how vision works in ordinary conditions when performance is limited by our intrinsic noise rather than externally added noise For instance reverse correlation aims at identifying the relevant information to perform a given task in noiseless conditions and measuring contrast thresholds in various noise levels can be used to understand the impact of intrinsic noise that limits sensitivity to noiseless stimuli Why use noise Since Fechner named it psychophysics has always emphasized the systematic investigation of conditions that break vision External noise raises threshold hugely and selectively In hearing Fletcher used noise in his famous critical band experiments to reveal frequency selective channels in

hearing Critical bands have been found in vision too More generally the big reliable effects of noise give important clues to how the system works And simple models have been proposed to account for the effects of visual noise As noise has been more widely used questions have been raised about the simplifying assumptions that link the processing properties in noiseless conditions to measurements in external noise For instance it is usually assumed that the processing strategy or mechanism used to perform a task and its processing properties e g filter tuning are unaffected by the addition of external noise Some have suggested that the processing properties could change with the addition of external noise e g change in filter tuning or more lateral masking in noise which would need to be considered before drawing conclusions about the processing properties in noiseless condition Others have suggested that different processing properties or mechanisms could be solicited in low and high noise conditions complicating the characterization of processing properties in noiseless condition based on processing properties identified in noise conditions The current Research Topic probes further into what the effects of visual noise tell us about vision in ordinary conditions Our Editorial gives an overview of the articles in this special issue
