Cira, Florentin Smarandache, 2014 In this book a multitude of Diophantine equations and their partial or complete solutions
are presented How should we solve for example the equation $x = \phi(x)$ where ϕ is the Smarandache function and ϕ is Riemann function
of counting the number of primes up to x in the set of natural numbers If an analytical method is not available an idea would
be to recall the empirical search for solutions We establish a domain of searching for the solutions and then we check all
possible situations and of course we retain among them only those solutions that verify our equation In other words we say
that the equation does not have solutions in the search domain or the equation has n solutions in this domain This mode of
solving is called partial resolution Partially solving a Diophantine equation may be a good start for a complete solving of the
problem The authors have identified 62 Diophantine equations that impose such approach and they partially solved them For
an efficient resolution it was necessarily that they have constructed many useful tools for partially solving the Diophantine
equations into a reasonable time The computer programs as tools were written in Mathcad because this is a good
