Approximate Models of Mechanics of Composites Igor V. Andrianov, Jan Awrejcewicz, Galina A. Starushenko, 2023-06-20 *Approximate Models of Mechanics of Composites* An Asymptotic Approach is an essential guide to constructing asymptotic models and mathematical methods to correctly identify the mechanical behavior of composites. It provides methodology for predicting and evaluating composite behavior in various structures leading to accurate mathematical and physical assessments. The book estimates the error of approximations through comparing asymptotic solutions with the results of numerical and analytical solutions to gain a holistic view of the data. The authors have developed asymptotic models based on mathematical and physical rigorous approaches which include three phase models of fibrous composites, a modernized three phase composite model with cylindrical inclusions and models of two dimensional composites of hexagonal structure. Also covered are two phase models of composites related to the Maxwell formula and a percolation transition model for elastic problems based on the self consistency method and Padé approximations. By obtaining analytical expressions to effectively characterize composite materials, their physical and geometric parameters can be accurately assessed. This book suits engineers and students working in material science, mechanical engineering, physics and mathematics as well as composite materials in industries such as construction, transport, aerospace and chemical engineering.

Asymptotical Mechanics of Composites Igor V. Andrianov, Jan Awrejcewicz, Vladyslav V. Danishevskyy, 2017-11-09 In this book the authors show that it is possible to construct efficient computationally oriented models of multi parameter complex systems by using asymptotic methods which can, owing to their simplicity, be directly used for controlling processes arising in connection with composite material systems. The book focuses on this asymptotic modeling based approach because it allows us to define the most important out of numerous parameters describing the system or, in other words, the asymptotic methods allow us to estimate the sensitivity of the system parameters. Further, the book addresses the construction of nonlocal and higher order homogenized models. Local fields on the micro level and the influence of so called non ideal contact between the matrix and inclusions are modeled and investigated. The book then studies composites with non regular structure and cluster type composite conductivity and analyzes edge effects in fiber composite materials. Transition of load from a fiber to a matrix for elastic and viscoelastic composites, various types of fiber composite fractures and buckling of fibers in fiber reinforced composites is also investigated. Last but not least, the book includes studies on perforated membranes, plates and shells as well as the asymptotic modeling of imperfect nonlinear interfaces.
