Optimization and Stability Theory for Economic Analysis Brian Beavis, Ian M. Dobbs, 1990 This book presents a coherent and systematic exposition of the mathematical theory of the problems of optimization and stability Both of these are topics central to economic analysis since the latter is so much concerned with the optimizing behaviour of economic agents and the stability of the interaction processes to which this gives rise The topics covered include convexity mathematical programming fixed point theorems comparative static analysis and duality the stability of dynamic systems the calculus of variations and optimal control theory The authors present a more detailed and wide ranging discussion of these topics than is to be found in the few books which attempt a similar coverage Although the text deals with fairly advanced material the mathematical prerequisites are minimised by the inclusion of an integrated mathematical review designed to make the text self contained and accessible to the reader with only an elementary knowledge of calculus and linear algebra A novel feature of the book is that it provides the reader with an understanding and feel for the kinds of mathematical techniques most useful for dealing with particular economic problems This is achieved through an extensive use of a broad range of economic examples rather than the numerical algebraic examples so often found This is suitable for use in advanced undergraduate and postgraduate courses in economic analysis and should in addition prove a useful reference work for practising economists

Advanced Mathematical Methods In Environmental And Resource Economics Anastasios Xepapadeas, 2022-09-20 The most interesting issues in environmental and resource economics have an explicit temporal dimension since variables of interest such as pollutants greenhouse gases biomass of biological resources or the stocks of fossil fuels accumulate in the ambient environment or are depleted through human actions and natural processes The purpose of these lectures is to present the mathematical tools for analyzing environmental and resource management issues in a dynamic set up The lectures include a brief description of differential equations and then move on to describe methods of optimal control dynamic programming and differential games The final chapters cover two novel topics 1 environmental issues characterized by deep uncertainty and aversion to ambiguity using robust control

methods and formulations of precautionary policies and 2 the study of pollution resource management in space and time when the environmental variables evolve in time and diffuse in space The lectures are a valuable tool for advanced graduate students in environmental and resource economics who are studying dynamic problems *Optimization Theory and Related Topics* Simeon Reich, Alexander J. Zaslavski, 2012 This volume contains the proceedings of the workshop on Optimization Theory and Related Topics held in memory of Dan Butnariu from January 11-14, 2010 in Haifa, Israel. An active researcher in various fields of applied mathematics, Butnariu published over 80 papers. His extensive bibliography is included in this volume. The articles in this volume cover many different areas of Optimization Theory and its applications: maximal monotone operators, sensitivity estimates via Lyapunov functions, inverse Newton transforms, infinite horizon Pontryagin principles, singular optimal control problems with state delays, descent methods for mixed variational inequalities, games on MV algebras, ergodic convergence in subgradient optimization, applications to economics and technology planning, the exact penalty property in constrained optimization, nonsmooth inverse problems, Bregman distances, retraction methods in Banach spaces, and iterative methods for solving equilibrium problems. This volume will be of interest to both graduate students and research mathematicians. Lectures In The Microeconomics Of Choice: Foundations, Consumers, And Producers William David Anthony Bryant, 2023-02-17 People pursue their own interests whatever those interests might be. Some people have interests that are narrow and selfish, while others have interests that are broad and altruistic. The idea that people are self-interested underpins all of economic analysis and raises two fundamental questions: 1. How do people choose the actions they think will further their own interests? 2. Can the potentially conflicting interests of different people be made to mesh in some sort of socio-economic equilibrium? This book is devoted to a detailed study of the first question. Its Companion Volume, *Economy Wide Microeconomics: Equilibrium, Optimality, Applications, and Tests*, makes a detailed study of the second question. Following some foundational remarks, this book studies the Arrow-Debreu theory of consumer choice. That theory supposes people choose so as to maximize a complete, continuous, transitive and reflexive binary preference relation over a non-empty and compact choice set. The book then studies numerous refinements, generalizations, and extensions of each of these restrictions, up to and including recent work on Behavioral theories of choice and choice behaviour when preferences are intransitive, incomplete, discontinuous. Also considered is choice behaviour in environments that are not necessarily compact. A study is also made of intertemporal choice and choice under uncertainty. The study of Arrow-Debreu choice theory and its extensions are presented from the Primal, Dual, and Revealed Preference points of view. Consumers are not the only agents in the economy as Producers are present as well. Beginning with a study of the Arrow-Debreu idea that producers choose from a convex production set so as to maximize profit, the book considers extensions and generalizations of this framework, particularly to non-convex environments. The study is presented from the Primal and Dual points of view. The final chapter in the book provides a link to its Companion Volume. The Chapter indicates how the theories of consumer and producer choice

studied here help inform answers of the second question posed above Resources are available to instructors who adopt this book More details at www.worldscientific.com/worldscibooks/10.1142/12789-sm **Canadian Mathematical Bulletin**, 1992-12 **Encyclopedia of Quantitative Risk Analysis and Assessment**, 2008-09-02 Leading the way in this field the Encyclopedia of Quantitative Risk Analysis and Assessment is the first publication to offer a modern comprehensive and in depth resource to the huge variety of disciplines involved A truly international work its coverage ranges across risk issues pertinent to life scientists engineers policy makers healthcare professionals the finance industry the military and practising statisticians Drawing on the expertise of world renowned authors and editors in this field this title provides up to date material on drug safety investment theory public policy applications transportation safety public perception of risk epidemiological risk national defence and security critical infrastructure and program management This major publication is easily accessible for all those involved in the field of risk assessment and analysis For ease of use it is available in print and online *Game Theoretic Analysis* Leon A Petrosyan, David W K Yeung, 2019-10-14 This is a collection of recent novel contributions in game theory from a group of prominent authors in the field It covers Non cooperative Games Equilibrium Analysis Cooperative Games and Axiomatic Values in static and dynamic contexts Part 1 Non cooperative Games and Equilibrium Analysis In game theory a non cooperative game is a game with competition between individual players and in which only self enforcing e g through credible threats alliances or competition between groups of players called coalitions are possible due to the absence of external means to enforce cooperative behavior e g contract law as opposed to cooperative games In fact non cooperative games are the foundation for the development of cooperative games by acting as the status quo Non cooperative games are generally analysed through the framework of equilibrium which tries to predict players individual strategies and payoffs Indeed equilibrium analysis is the centre of non cooperative games This volume on non cooperative games and equilibrium analysis contains a variety of non cooperative games and non cooperative game equilibria from prominent authors in the field Part 2 Cooperative Games and Axiomatic Values It is well known that non cooperative behaviours in general would not lead to a Pareto optimal outcome Highly undesirable outcomes like the prisoner s dilemma and even devastating results like the tragedy of the commons could appear when the involved parties only care about their individual interests in a non cooperative situation Cooperative games offer the possibility of obtaining socially optimal and group efficient solutions to decision problems involving strategic actions In addition axiomatic values serve as guidance for establishing cooperative solutions This volume on cooperative games and axiomatic values presents a collection of cooperative games and axiomatic values from prominent authors in the field
