Colwell, 2006-10-12 The importance of combating infectious diseases has received international attention p viding the opportunity for a multidisciplinary approach that combines medicine with other scienti

candtechnological capabilities notably information technology nanotechnology and biotechnology. In fact it has been predicted that the future will bring a merging of these te nologies with the cognitive and behavioral sciences major forces that have the potential to balance the world sine quities. The scientic community and world leaders must work together to use knowledge and its applications to improve the condition of the planet. The connection between infectious diseases and the oceans provides a paradigm for this perspective. A stark global context indisputably frames all human health issues in the twenty rst century the world wide movement of people and goods. Throughout the past half century international travel has skyrocketed there are more than 500 million international arrivals per year. The greatest increase has taken place since the mid 1990s. The world has become integrated and global consequently the notion that it is possible to successfully eradicate a disease from the face of the planet has become simplistic Infectious disease is a moving target and climate shifts will affect any disease that has an environmentally sensitive stage or vector

Recognizing signals from climate models and incorporating the mint ohealth measures can pive every experiment of the control o ratherthanreactive approachestopublichealth Thus careful attention to the role of the oceans in human health can offer new avenues of research that will provide new means of predicting and preventing those diseases that are rooted in the environment In this volume pathogens in the sea are reviewed by ColinMunn who provides a broader perspective for the topic of pathogenic microorganisms associated with the world oceans **Marine Bioprospecting for Sustainable** Blue-bioeconomy Sesan Abiodun Aransiola, Abayomi Bamisaye, Olabisi Peter Abioye, Naga Raju Maddela, 2024-10-03 This volume comprehensively discusses marine bioprospecting and its applications in the marine bioeconomy specifically in clean energy generation and in biomedical industrial and agricultural sectors. The advent of modern technology particularly advancements in deep sea exploration and biotechnology has enabled scientists to delve deeper into the ocean s depths and discover a treasure trove of unique organisms and compounds This demonstrates that the rich history of human interactions with the oceans is firmly ingrained in marine bioprospecting The blue economy which is a more accurate name for the systematic search for valuable substances and organisms in the water has gained popularity in recent years as a possible route for sustainable economic development One of the key driving factors behind marine bioprospecting is the growing realization that marine organisms possess unique biochemical compounds with the potential to revolutionize various industries These compounds include novel enzymes antimicrobial agents bioactive molecules and even potential pharmaceuticals Readers will learn about the applications of these discoveries in bioremediation wastewater treatment and biofuel production as well as the identification of natural substitutes for things that are detrimental to the environment which include biodegradable plastics derived from marine microorganisms. The primary audience for the book will be governmental and international organizations professionals and economists while the secondary audience will be professors and researchers in the fields of Chemistry Biotechnology Environmental Microbiology and general Ocean Sciences Green
