[Obstacle Avoidance Guidance for Unmanned Aerial Vehicles](#) Garrett Stuart Clem, 2018 Unmanned Aerial Vehicles UAVs conventionally navigate by following a series of pre planned waypoints When encountering an obstacle in flight such as no fly zones or other aircraft the vehicle's path or waypoints may need to be re planned Waypoint guidance can be used to avoid obstacles which are typically generated off line and relayed to the UAV requiring active communications Vector Fields VFs that are generated based on a desired path can provide guidance around a newly discovered obstacle without the need for a re plan VF convergence and circulation components were optimized to minimize deviation from a desired path when guiding around a circular obstacle Results indicated that the developed VF obstacle avoidance optimizer provides similar path deviation performance as waypoints without the need for re planning
