The Complete Technology Book on Fibre Glass, Optical Glass and Reinforced Plastics NIIR Board of Consultants and Engineers,2006-10-01 Although many natural materials were used in the past by man answering his instinctive urges to prevent heat loss from or entry into his dwellings no material in modern technology has satisfied the all around requirements as has fiber Glass Fiber glass optical glass and reinforced plastics have important applications and uses in the making of various products Fiberglass is a lightweight extremely strong and robust material Although strength properties are somewhat lower than carbon fiber and it is less stiff the material is typically far less brittle and the raw materials are much less expensive Its bulk strength and weight properties are also very favorable when compared to metals and it can be easily formed using molding processes Fibre glass behaves as a thermal insulation because of its entrapment of small cells of air and prevention of movement of the air in those cells In acoustical applications fibre glass presents to advancing sound waves a myriad of small anechoic chambers which reflect the sound inward from many diverse surfaces until it becomes blotted out Optical glass is a high glass material that has been seen specifically formulated to possess certain desirable characteristics that effect the propagation of light The two primary parameters that define the basic types of optical glass are its refractive index and its dispersion Transportation on wheel is of special significance to the reinforced plastics industry on a number of counts Suppliers of reinforced plastics parts are often called upon to furnish prototypes of products being considered for auto truck and bus applications Performance and quality demands on materials used in aerospace vehicles have given rise to many plastics developments and have kept profits in the
