Grafting and Budding in Fruit Trees Sherif Fathy Eid El-Sayed EL Gioushy, Yasser Mohammed Hussein, 2013 Many people mistakenly believe that fruit trees grow true to name from seeds In reality if you collect seed from a fruit grown on a plant the seeds will produce plants that will be a hybrid of two plants The new plant will be the same kind of plant but its fruit and vegetative portions may not look the same as the parent because the plant is heterozygous Therefore all fruit trees must be vegetatively propagated by either grafting or budding methods Fruit growers frequently use grafting techniques to topwork new varieties or strains of fruit onto established trees bearing misnamed or obsolete varieties and to repair injury or damage caused by mice rabbits deer or mechanical means Commercial nursery workers propagate new fruit trees and producing a tree ready for planting takes several years All of the temperate zone deciduous fruit plants may be propagated by budding Cleft whip and bridge grafting of apple and pear is possible but such grafts are not often successful on stone fruits Sweet cherry and occasionally peach may be successfully grafted using the side graft onto a 2 to 3 year old limb
