

PHET Magnetism - Lab Guide

Part 1

Today you will be exploring magnets and electromagnets through a simulation provided by the University of Colorado at Boulder.

1. Click "understanding" under "questions" (see: "Magnetic and Electromagnetic" below the title). Select "place a bar magnet around the loop" as the question to answer.

2. Move the compass slowly along outside the loop until the bar magnet will no longer block the opposite poles of the magnet. Observe what happens to the compass needle.

The compass has the ability to give you information about direction. It is often used to indicate where geographic north is. There is true north and it is marked on the map. The compass points toward it, but because the earth's magnetic field is shifted a bit, that's not

3. When the bar magnet the compass needle starts to tip the compass will point?

It will be like the magnet affects the compass and is pulled.

4. How is the strength of the electromagnet on the compass needle affected?

It is approximately a perpendicular distance.

5. What are the relationships between the compass needle (magnet) and a bar magnet (wire)?

We know that there is a magnetic field around the wire and that the compass needle is affected. The compass needle will point towards the wire and the wire will point towards the compass.

6. Move the compass along a circular path below the bar magnet until you are past it on the opposite side of the bar magnet. Observe what happens to the compass needle.

When you are at the bar magnet, the compass needle is pointing towards the bar magnet. When you are at the opposite side of the bar magnet, the compass needle is pointing away from the bar magnet. This is because the magnetic field is a vector field and it is a vector field.
