Cleophas,Aeilko H. Zwinderman,2014-05-27 The amount of data medical databases doubles every 20 months and physicians are at a loss to analyze them Also traditional data analysis has difficulty to identify outliers and patterns in big data and data with multiple exposure outcome variables and analysis rules for surveys and questionnaires currently common methods of data collection are essentially missing Consequently proper data based health decisions will soon be impossible Obviously it is time that medical and health professionals mastered their reluctance to use machine learning methods and this was the main incentive for the authors to complete a series of three textbooks entitled Machine Learning in Medicine Part One Two and Three Springer Heidelberg Germany 2012 2013 describing in a nonmathematical way over sixty machine learning methodologies as available in SPSS statistical software and other major software programs Although well received it came to our attention that physicians and students often lacked time to read the entire books and requested a small book without background information and theoretical discussions and highlighting technical details For this reason we produced a 100 page cookbook entitled Machine Learning in Medicine Cookbook One with data examples available at extras springer com for self assessment and with reference to the above textbooks for background information Already at the completion of this cookbook we came to realize that many essential methods were not covered The current volume entitled Machine Learning in Medicine Cookbook Two is complementary to the first and also intended for providing a more balanced view of the field and thus as a must read not only for physicians and students but also for any one involved in the process and progress of health and health care Similarly to Machine Learning in Medicine Cookbook One the current work will describe stepwise analyses of over twenty machine learning methods that are likewise based on the three major machine learning methodologies Cluster methodologies Chaps 1 3 Linear methodologies Chaps 4 11 Rules methodologies Chaps 12 20 In extras springer com the data files of the examples are given as well as XML Extended Mark up Language SPS Syntax and ZIP compressed files for outcome predictions in future patients In addition to condensed versions of the methods fully described in the above three textbooks an introduction is given to SPSS Modeler SPSS data mining workbench in the Chaps 15 18 19 while improved statistical methods like various automated analyses and Monte Carlo simulation models are in the Chaps 1 5 7 and 8 We

should emphasize that all of the methods described have been successfully applied in practice by the authors both of them professors in applied statistics and machine learning at the European Community College of Pharmaceutical Medicine in Lyon France We recommend the current work not only as a training companion to investigators and students because of plenty of step by step analyses given but also as a brief introductory text to jaded clinicians new to the methods For the latter purpose background and theoretical information have been replaced with the appropriate references to the above textbooks while single sections addressing general purposes main scientific questions and conclusions are given in place Finally we will demonstrate that modern machine learning performs sometimes better than traditional statistics does Machine learning may have little options for adjusting confounding and interaction but you can add propensity scores and interaction variables to almost any machine learning method

Machine Learning in Medicine - A Complete Overview Ton J. Cleophas, Aeilko H. Zwinderman, 2020-03-03 Adequate health and health care is no longer possible without proper data supervision from modern machine learning methodologies like cluster models neural networks and other data mining methodologies The current book is the first publication of a complete overview of machine learning methodologies for the

medical and health sector and it was written as a training companion and as a must read not only for physicians and students but also for any one involved in the process and progress of health and health care In this second edition the authors have removed the textual errors from the first edition Also the improved tables from the first edition have been replaced with the original tables from the software programs as applied This is because unlike the former the latter were without error and readers were better familiar with them The main purpose of the first edition was to provide stepwise analyses of the novel methods from data examples but background information and clinical relevance information may have been somewhat lacking Therefore each chapter now contains a section entitled Background Information Machine learning may be more informative and may provide better sensitivity of testing than traditional analytic methods may do In the second edition a place has been given for the use of machine learning not only to the analysis of observational clinical data but also to that of controlled clinical trials Unlike the first edition the second edition has drawings in full color providing a helpful extra dimension to the data analysis Several machine learning methodologies not yet covered in the first edition but increasingly important today have been included in this updated edition for example negative binomial and Poisson regressions sparse canonical analysis Firth's bias adjusted logistic analysis omics research eigenvalues and eigenvectors
