Holt Rinehart Concept Mapping Evolution:

Mapping Biology Knowledge K. Fisher, J.H. Wandersee, D.E. Moody, 2006-04-11 *Mapping Biology Knowledge* addresses two key topics in the context of biology promoting meaningful learning and knowledge mapping as a strategy for achieving this goal. Meaning making and meaning building are examined from multiple perspectives throughout the book. In many biology courses students become so mired in detail that they fail to grasp the big picture. Various strategies are proposed for helping instructors focus on the big picture using the need to know principle to decide the level of detail students must have in a given situation. The metacognitive tools described here serve as support systems for the mind creating an arena in which learners can operate on ideas. They include concept maps, cluster maps, webs, semantic networks, and conceptual graphs. These tools compared and contrasted in this book are also useful for building and assessing students' content and cognitive skills. The expanding role of computers in mapping biology knowledge is also explored. **Chapter Resource 13**

Species, Species Concepts and Primate Evolution William H. Kimbel, Lawrence B. Martin, 2013-12-18 A world of catagones devmd of spirit waits for life to return Saul Bellow Humboldt s Gift The stock in trade of communicating hypotheses about the historical path of evolution is a graphical representation called a phylogenetic tree In most such graphics pairs of branches diverge from other branches successively marching across abstract time toward the present To each branch is tied a tag with a name a binominal symbol that functions as does the name given to an individual human being On phylogenetic trees the names symbolize species What exactly do these names signify What kind of information is communicated when we claim to have knowledge of the following types Tetonius mathewzi was ancestral to Pseudotetonius ambiguus The sample of fossils attributed to Homo habzlis is too variable to contain only one species Interbreeding populations of savanna baboons all belong to Papio anubis Hylobates lar and H pileatus interbreed in zones of geographic overlap While there is nearly universal

agreement that the notion of the species is fundamental to our understanding of how evolution works there is a very wide range of opinion on the conceptual content and meaning of such particular statements regarding species This is because oddly enough evolutionary biologists are quite far from agreement on what a species is how it attains this status and what role it plays in evolution over the long term *Videodisc Correlation GD Modern Biology 99* Holt Rinehart & Winston, 1998-02
