Palik, 1997-12-10 This set of five volumes four volumes edited by Edward D Palik and a volume by Gorachand Ghosh is a unique resource for any science and technology library It provides materials researchers and optical device designers with reference facts in a context not available anywhere else The singular functionality of the set derives from the unique format for the three core volumes that comprise the Handbook of Optical Constants of Solids The Handbook satisfies several essential needs first it affords the most comprehensive database of the refractive index and extinction or loss coefficient of technically important and scientifically interesting dielectrics This data has been critically selected and evaluated by authorities on each material Second the dielectric constant database is supplemented by tutorial chapters covering the basics of dielectric theory and reviews of experimental techniques for each wavelength region and material characteristic As an additional resource two of the tutorial chapters summarize the relevant characteristics of each of the materials in the database The data in the core volumes have been collected and analyzed over a period of twelve years with the most recent completed in 1997 The volumes systematically define the dielectric properties of 143 of the most engaging materials including metals semiconductors and insulators Together the three Palik books contain nearly 3 000 pages with about 2 3 devoted to the dielectric constant data The tutorial chapters in the remaining 1 3 of the pages contain a wealth of information including some dielectric data Hence the separate volume Index to Handbook of Optical Constants of Solids which is included as part of the set substantially

enhances the utility of the Handbook and in essence joins all the Palik volumes into one unit. It is then of great importance to users of the set. A final volume rounds out the set. The Handbook of Thermo-Optic Coefficients of Optical Materials with Applications collects refractive index measurements and their temperature dependence for a large number of crystals and glasses. Mathematical models represent these data and in turn are used in the design of nonlinear optical devices. Unique source of extremely useful optical data for a very broad community of scientists, researchers and practitioners. Will be of great practical applicability to both industry and research. Presents optical constants for a broadest spectral range for a very large number of materials. Palik's three volumes include 143 materials including 43 elements. Ghosh's volume includes some 70 technologically interesting crystals and many commercial glasses. Includes a special index volume that enables the user to search for the information in the three Palik volumes easily and quickly. Critique chapters in the Palik volumes discuss the data and give reference to most of the literature available for each material. Presents various techniques for measuring the optical constants and mathematical models for analytical calculations of some data.

Handbook of Infrared Optical Materials Paul Klocek, 2019-12. This book includes a comprehensive presentation of the fundamental physics of optical matter, the definition of material physical properties, the listing and comparison of the physical properties of infrared optical materials and the theory, design and survey of infrared optical coatings.

Physical Properties and Data of Optical Materials Moriaki Wakaki, Takehisa Shibuya, Keiei Kudo, 2018-10-08. Research and applications in optical engineering require careful selection of materials. With such a large and varied array to choose from, it is important to understand a material's physical and optical properties before making a selection. Providing a convenient, concise and logically organized collection of information, Physical Properties and Data of Optical Materials builds a thorough background for more than 100 optical materials and offers quick access to precise information. Surveying the most important and widely used optical materials, this handy reference includes data on a wide variety of metals, semiconductors, dielectrics, polymers and other commonly used optical materials. For each material, the editors examine the crystal system, natural and artificial growth and production methods, along with corrosives and processing, thermal, electrical and mechanical properties, optical properties such as transmittance and reflectance spectra ranging from UV to IR wavelengths and where applicable, applications for spectroscopy and miscellaneous remarks such as handling concerns and chemical properties. Numerous tables illustrate important data such as numerical values of optical constants for important wavelength regions, extinction and absorption coefficients and refractive index.
