

Homeostasis and Cell Transport Study Guide

- **Obj. 1.1.1** Explain how homeostasis is maintained in a cell and within an organism's system (endotherms/exotherms, osmoregulation) and pH.
- **Obj. 1.1.2** Analyze the cellular and physiological responses to changes in temperature, osmolarity, and pH in various organisms.
- **Obj. 1.1.3** Explain why organisms require energy for maintaining homeostasis (active transport).

QUESTION	ANSWER
1. Explain homeostasis: internal factors, external factors, and external environmental challenges that organisms face and how they maintain the balance. (20%)	Homeostasis is a dynamic process where the body tries to maintain its internal environment. It involves internal factors like hormones and external factors like temperature, pH, and osmolarity. The body uses various mechanisms to maintain balance, such as sweating, shivering, and breathing.
2. How does a homeotherm deal with heat? (10%)	Homeotherms, like humans, maintain a constant body temperature. They use various mechanisms to deal with heat, such as sweating, vasodilation, and behavioral changes like seeking shade.
3. How does a poikilotherm deal with heat? (10%)	Poikilotherms, like reptiles, do not maintain a constant body temperature. They rely on external sources of heat, such as the sun, to warm their bodies. They use behavioral changes like basking in the sun to absorb heat.
4. What are the three types of energy used in the human body? (10%)	The three types of energy used in the human body are: <ul style="list-style-type: none"> 1. Kinetic energy: the energy of motion. 2. Potential energy: the energy stored in a system. 3. Chemical energy: the energy stored in the bonds of molecules.
5. Explain homeostasis in a human body. (10%)	Homeostasis is the process by which the body maintains a stable internal environment. It involves the use of various mechanisms, such as hormones, nerves, and feedback loops, to regulate body temperature, pH, and osmolarity.
6. Explain the role of the cell membrane in homeostasis. (10%)	The cell membrane is a phospholipid bilayer that acts as a barrier between the cell and its environment. It is selectively permeable, allowing some substances to pass while blocking others. This helps maintain the cell's internal environment and prevents the loss of water and ions.
