Ahmed, 2009-09-14 In today s unforgiving business environment where customers demand zero defect software at lower costs it is testing that provides the opportunity for software companies to separate themselves from the competition Software Testing as a Service explains in simple language how to use software testing to improve productivity reduce time to market and reduce costly errors It explains how the normal functions of manufacturing can be applied to commoditize the software testing service to achieve consistent quality across all software projects This up to date reference reviews different software testing tools techniques and practices and provides succinct guidance on how to estimate costs allocate resources and make competitive bids Replete with examples and case histories this resource illustrates how proper planning can lead to the creation of software that s head and shoulders above the competition *InfoWorld* , 2004-09-27 InfoWorld is targeted to Senior IT professionals Content is segmented into Channels and Topic Centers InfoWorld also celebrates people companies and projects Cost Accounting for Shared IT Infrastructures Reinhard Brandl, 2008-08-21 During the past few years

determining the value of IT has ranked high on the agenda of IT managers and Chief Information Officers CIOs The rather broad and abstract topic has been intensively discussed in the Information Systems literature for many years It turns into a very tangible problem in the field of IT cost accounting Nowadays corporate information systems are distributed systems A detailed measurement of resource demands of IT services on a distributed IT infrastructure and respective accounting and cost allocation turns out to be very expensive and impractical in most cases The large proportion of indirect costs and the difficulty of finding adequate allocation rates are a significant problem in practice regularly leading to free rider problems This problem has largely been ignored in the academic literature so far Dr Brandl proposes a method to derive estimators for the resource demand of service requests in a distributed IT infrastructure This estimator is based on a set of load tests and respective measurements as they are often performed during the deployment phase of new information systems Cost allocation keys can now be determined based on the number of service invocations per user or per department and the respective estimators While these measurements provide a lean method for the determination of usage based cost allocation keys it is not obvious that the estimators have sufficient accuracy in particular concerning different types of services and volatile workloads
