*Sustainable Shipping* Harilaos N. Psaraftis, 2019-02-11

International shipping is currently at a crossroads. The decision of the International Maritime Organization (IMO) in April 2018 to adopt an Initial Strategy so as to achieve by 2050 a reduction of at least 50% in maritime greenhouse gas (GHG) emissions vis-à-vis 2008 levels epitomizes the last among a series of recent developments as regards sustainable shipping. It also sets the scene on what may happen in the future. Even though many experts and industry circles believe that the IMO decision is in line with the COP21 climate change agreement in Paris in 2015, others disagree either on the ground that the target is not ambitious enough or on the ground that no clear pathway to reach the target is currently visible. This book takes a cross-disciplinary view of the various dimensions of the maritime transportation sustainability problem. Cross-disciplinary means that a variety of angles are used to examine the book topics and these mainly include the technological angle, the economics angle, the logistics angle and the environmental angle. The book reviews models that can be used to evaluate decisions, policy alternatives and trade-offs. For sustainable shipping, a spectrum of technical, logistics-based and market-based measures are being contemplated. All may have important side effects as regards the economics and logistics of the maritime supply chain, including ports and hinterland connections. The objective to attain an acceptable environmental performance while at the same time respecting traditional economic performance criteria so that shipping remains viable is and is likely to be a central goal for both industry and policy makers in the years ahead. At the same time, policy fragmentation is likely to create distortions of competition and sub-optimal solutions. This book attempts to address these issues and identify better solutions.

*Sustainable Shipping: A Cross-Disciplinary View* includes chapters that cover many relevant topics. These include a general view of maritime transport sustainability, green ship technologies, information and communication technologies (ICTs) for sustainable shipping, green tramp ship routing and scheduling, green liner network design and speed optimization, market-based measures, oil pollution, ship recycling, sulphur emissions, ballast water management, alternative fuels and green ports.

are also covered The book concludes by discussing prospects for the future with a focus on the IMO Initial Strategy This book contains a unique wealth of information on sustainable shipping The knowledge it provides is rigorous complete and well supported by statistics technical reports and scientific references The treatment of the various topics is not only informative but also analytical and critical Gilbert Laporte Maritime Economics Logistics 12 May 2020 Sustainability in the Maritime Domain Angela Carpenter,Tafsir M.
