Machine Design Data Handbook is meant for Mechanical Production and Industrial Engineering branches. The book contains data in the form of equations, tables, and graphs. The first chapter deals with the basic equations derived in mechanics of materials and helps in determining stresses in machine elements under various loading situations. The second chapter contains data of mechanical properties of various engineering materials used for the machine elements. The third chapter deals with the various theories used for predicting failures under static and fluctuating loads. It also deals with the methods used for estimating the life to failure under variable loadings. The chapter on fits and tolerances is intended to help in specifying the manufacturing tolerances. These chapters are useful in solving any general design problems. The remaining chapters are dedicated to individual machine elements. The standard procedures adopted for each machine are presented in individual chapters. A new chapter on Vibrations has also been added in this edition. The standards prescribed by ISI, BIS, ISO, and AGMA Standards organisations are included. The S I system of units has been adopted throughout the book. A short list of conversion factors for important quantities is given in the beginning. A complete list of conversion factors for the various physical quantities is given in the Appendix at the end of the book. These are useful in solving problems in Metric units also. Thus the book is useful for both the systems of units. The book is intended to train the students, teachers, and practicing engineers for solving and preparation of working design projects.

Virtual Manufacturing Wasim Ahmed Khan, Abdul Raouf, Kai Cheng, 2011-02-16. Virtual Manufacturing presents a novel concept of combining human-computer interfaces with virtual reality for discrete and continuous manufacturing systems. The authors address the relevant concepts of manufacturing engineering, virtual reality, and computer science and engineering before embarking on a description of the methodology for building augmented reality for manufacturing processes and manufacturing systems. Virtual Manufacturing is centered on the description of the development of augmented reality models for a range of processes based on CNC, PLC, SCADA, mechatronics, and on embedded systems. Further discussions address the use of augmented reality for developing augmented reality models to control contemporary manufacturing systems and to acquire micro and macro level decision parameters for managers to boost profitability of their manufacturing systems. Guiding readers through the building of their own virtual factory software, Virtual Manufacturing comes with access to online files and software that will enable readers to create a virtual factory, operate it, and experiment with it. This is a valuable source of information with a useful toolkit for anyone interested in virtual manufacturing, including advanced undergraduate students, postgraduate students, and researchers.
