Modeling Life Alan Garfinkel, Jane Shevtsov, Yina Guo, 2017-09-06 This book develops the mathematical tools essential for students in the life sciences to describe interacting systems and predict their behavior From predator prey populations in an ecosystem to hormone regulation within the body the natural world abounds in dynamical systems that affect us profoundly Complex feedback relations and counter intuitive responses are common in nature this book develops the quantitative skills needed to explore these interactions Differential equations are the natural mathematical tool for quantifying change and are the driving force throughout this book The use of Euler s method makes nonlinear examples tractable and accessible to a broad spectrum of early stage undergraduates thus providing a practical alternative to the procedural approach of a traditional Calculus curriculum Tools are developed within numerous relevant examples with an emphasis on the construction evaluation and interpretation of mathematical models throughout Encountering these concepts in context students learn not only quantitative techniques but how to bridge between biological and mathematical ways of thinking Examples range broadly exploring the dynamics of neurons and the immune system through to population dynamics and the Google PageRank algorithm Each scenario relies only on an interest in the natural world no biological expertise is assumed of student or instructor Building on a single prerequisite of Precalculus the book suits a two quarter sequence for first or second year undergraduates and meets the mathematical requirements of medical school entry The later material provides opportunities for more advanced students in both mathematics and life sciences to revisit theoretical knowledge in a rich real world framework In all cases the focus is clear how does the math help us understand the science Partial Differential Equations Wolfgang Arendt, Karsten Urban, 2023-01-01 This textbook introduces the study of partial differential equations using both analytical and numerical methods By intertwining the two complementary approaches the authors create an ideal foundation for further study Motivating examples from the physical sciences engineering and economics complete this

integrated approach A showcase of models begins the book demonstrating how PDEs arise in practical problems that involve heat vibration fluid flow and financial markets Several important characterizing properties are used to classify mathematical similarities then elementary methods are used to solve examples of hyperbolic elliptic and parabolic equations From here an accessible introduction to Hilbert spaces and the spectral theorem lay the foundation for advanced methods Sobolev spaces are presented first in dimension one before being extended to arbitrary dimension for the study of elliptic equations An extensive chapter on numerical methods focuses on finite difference and finite element methods Computer aided calculation with Maple™ completes the book Throughout three fundamental examples are studied with different tools Poisson s equation the heat equation and the wave equation on Euclidean domains The Black Scholes equation from mathematical finance is one of several opportunities for extension Partial Differential Equations offers an innovative introduction for students new to the area Analytical and numerical tools combine with modeling to form a versatile toolbox for further study in pure or applied mathematics Illuminating illustrations and engaging exercises accompany the text throughout Courses in real analysis and linear algebra at the upper undergraduate level are assumed
