

- Examples of databases: MySQL, Access, and node.js

HTTP Server	Database	Scripting Language
Operating System (Linux, Windows, Mac)		
Hardware		

Flat File

- Flat files are where databases are stored in one file, typically separated by markers that identify where records/elements start and end
 - Examples: Excel and other spreadsheet programs
- One-to-many relationships: A single entity is associated with many other entities
- The nature of all data being on one file makes the database easily accessible and portable

Structured Query/Relational Database

- Structured Query Databases are similar to flat files when it comes to how they can be viewed
 - Viewed as its own table, similar to a single spreadsheet
- Instead of having one large database like a flat file, a Structured Query breaks up data based on user needs and groups related data into tables
 - Multi-Page Spreadsheet, each page containing different information

Movie Example

Page 1: Studio		
Name	Opening Date	Tax Code

Page 2: Movies				
Name	Release	Date	Description	Production Cost

- Structured Query Databases is a relatively human-readable sentence structure language that uses a fixed vocabulary to describe certain data we want and how we want to use it
- Many-to-many Relationships: Multiple records in a table associated with multiple records in another table
 - Ex. An actor can be in many different movies and a movie can have many different actors
- Query languages can be used to ask the database to find records based on certain tables of data
- This style can be efficient when it comes to storage size, though interacting with the data through queries can be difficult as both one-to-many and many-to-many relationships are best represented through intermediary tables
