This book is addressed to students and professionals and it is aimed to cover as much as possible the broader region of topographic mapping as it has evolved into a modern field called geospatial information science and technology More emphasis is placed on using scientific methods and tools materialized in algorithms and software to produce practical results For this reason beyond the written material there are also many educational and professional software programs written by

the first author to help comprehend the individual methodologies developed The Target of this book is to provide the people who work in fields of applications of topographic mapping environment geology geography cartography engineering geotechnical agriculture forestry geointelligence etc a source of knowledge for the broader region so that to help them in facing relevant problems as well as in preparing contracts and specifications for such type of work assigned to professionals and evaluating such contracting results It also aims to be a reference for theory and practice for professionals in Topographic Mapping This book applies a didactics method where with a relatively small effort someone can digest a large volume of simple or complicated knowledge material at a desirable scientific depth within a relatively short time interval The objective that educated people must be smarter than the machine and not treat the machine as a black box being button pushers has been achieved through the first author s experience in the USA and Greece with relative success by adopting this didactics technique There are 14 chapters including Reference systems and Projections Topographic instruments and Geometry of coordinates Conventional construction of a topographic map Design and reproduction of a thematic map Digital Topographic mapping GIS Digital Terrain Models DTM DEM GPS GNSS methods of Photogrammetry Remote Sensing new technologies LIDAR IFSAR Augmented reality Mapping with UAS UAV Drones the method of Least Squares adjustment and Description of educational software accompanying the text **A Research Guide to Cartographic Resources** Eva H.

Dodsworth,2018-09-22 The interdisciplinary uses of traditional cartographic resources and modern GIS tools allow for the analysis and discovery of information across a wide spectrum of fields A Research Guide to Cartographic Resources navigates the numerous American and Canadian cartographic resources available in print and online offering researchers academics and students with information on how to locate and access the large variety of resources new and old Dozens of different cartographic materials are highlighted and summarized along with lists of map libraries and geospatial centers and related professional associations A Research Guide to Cartographic Resources consists of 18 chapters two appendices and a detailed index that includes place names and libraries structured in a manner consistent with most reference guides including cartographic categories such as atlases dictionaries gazetteers handbooks maps plans GIS data and other related material Almost all of the resources listed in this guide are categorized by geography down to the county level making efficient work of the type of material required to meet the information needs of those interested in researching place specific cartographic related resources Additionally this guide will help those interested in not only developing a comprehensive collection in these subject areas but get an understanding of what materials are being collected and housed in specific map libraries geospatial centers and their related websites Of particular value are the sections that offer directories of cartographic and GIS libraries as well as comprehensive lists of geospatial datasets down to the county level This volume combines the traditional and historical collections of cartography with the modern applications of GIS based maps and geospatial datasets
