

# HOW PHASE DETECTION AUTOFOCUS WORKS

This cross-section of a Nikon D4 shows how the autofocus system works in most DSLRs

## 01 Main mirror

This is semi-silvered so that the image formed by the lens passes mostly up into the pentaprism and the viewfinder, but some passes through on to the sub-mirror behind.

## 02 Sub-mirror

This reflects the image down into the base of the camera where the AF sensor is located. The sub-mirror flattens against the back of the main mirror when it flips up during the exposure.

## 03 Autofocus sensor

Different Nikon DSLRs use different autofocus sensors – the pro-level D4 uses Nikon's top-of-the-range 51-point Multi-CAM 3500FX sensor.

## 04 Light path: view finder

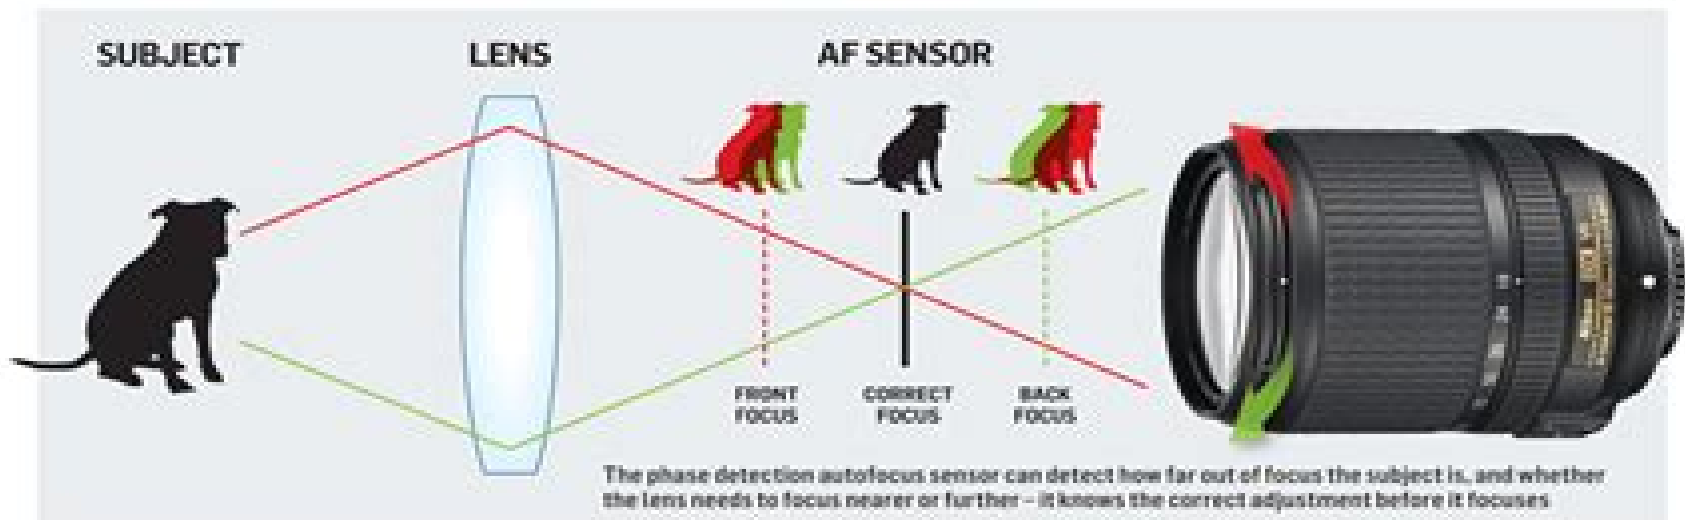

This is the route the image takes to reach the viewfinder.

## 05 Light path: AF sensor

... and this is the light path for the autofocus sensor.

Unlike most other types of digital camera, digital SLRs use separate 'phase-detection' AF sensors

The phase detection autofocus sensor can detect how far out of focus the subject is, and whether the lens needs to focus nearer or further – it knows the correct adjustment before it focuses
