

MATH REVIEW

Math Review is a comprehensive study aid for students preparing for the SAT, ACT, and other standardized tests. It covers a wide range of mathematical topics, including algebra, geometry, and statistics, and provides clear explanations and examples for each concept.

ALGEBRA

Variables

A variable is a symbol that represents a number that can change. Variables are used in algebra to represent unknown quantities. For example, in the equation $x + 5 = 10$, x is a variable that represents a number that, when added to 5, equals 10.

Variables are often used to represent numbers in a sequence or pattern. For example, in the sequence 2, 4, 6, 8, 10, the variable n can be used to represent the n th term of the sequence. The formula for the n th term of this sequence is $2n$.

Variables are also used to represent numbers in a formula. For example, the formula for the area of a rectangle is $A = lw$, where A is the area, l is the length, and w is the width.

Equations

An equation is a statement that two expressions are equal. Equations are used to solve for unknown values. For example, the equation $x + 5 = 10$ can be solved by subtracting 5 from both sides, resulting in $x = 5$.

Equations are also used to represent relationships between variables. For example, the equation $y = 2x + 3$ represents a linear relationship between x and y .

Equations are also used to represent relationships between numbers. For example, the equation $2 + 3 = 5$ represents the relationship between the numbers 2, 3, and 5.

Formulas

A formula is a rule that tells how to calculate a value. Formulas are used to solve problems. For example, the formula for the area of a rectangle is $A = lw$.

Formulas are also used to represent relationships between variables. For example, the formula $y = 2x + 3$ represents a linear relationship between x and y .

Formulas are also used to represent relationships between numbers. For example, the formula $2 + 3 = 5$ represents the relationship between the numbers 2, 3, and 5.

GEOMETRY

Points, Lines, and Planes

A point is a location in space. A line is a straight path that extends infinitely in both directions. A plane is a flat surface that extends infinitely in all directions.

Points, lines, and planes are the basic building blocks of geometry. They are used to describe the shape and size of objects in the world around us. For example, a point can represent a location on a map, a line can represent a road, and a plane can represent a wall.

Angles

An angle is formed by two rays that share a common endpoint. The common endpoint is called the vertex of the angle. The rays are called the sides of the angle.

Angles are measured in degrees. A right angle is an angle that measures 90 degrees. A straight angle is an angle that measures 180 degrees.

Angles are also used to describe the shape of objects. For example, a triangle is a three-sided polygon, and a square is a four-sided polygon with four right angles.

Area and Perimeter

The area of a shape is the amount of space it covers. The perimeter of a shape is the distance around it. Area and perimeter are used to solve problems involving shapes.

For example, the area of a rectangle is calculated by multiplying the length by the width. The perimeter of a rectangle is calculated by adding the length and width together and multiplying by 2.

Volume and Surface Area

The volume of a solid is the amount of space it occupies. The surface area of a solid is the total area of its faces. Volume and surface area are used to solve problems involving solids.

For example, the volume of a rectangular prism is calculated by multiplying the length, width, and height together. The surface area of a rectangular prism is calculated by adding the area of all six faces together.

Volume and surface area are also used to solve problems involving other solids, such as cylinders, cones, and spheres.

Volume and surface area are also used to solve problems involving real-world objects. For example, the volume of a container can be used to determine how much liquid it can hold, and the surface area of a box can be used to determine how much material is needed to make it.

Volume and surface area are also used to solve problems involving other solids, such as cylinders, cones, and spheres.

Probability and Statistics

Probability is the chance that an event will occur. Statistics is the study of data. Probability and statistics are used to solve problems involving chance and data.

For example, probability can be used to determine the chance of winning a game, and statistics can be used to analyze data from a survey.

Counting Principles

Counting principles are rules that tell how to count the number of ways an event can occur. Counting principles are used to solve problems involving counting.

For example, the counting principle for permutations tells how to count the number of ways to arrange a set of objects. The counting principle for combinations tells how to count the number of ways to choose a subset of objects from a larger set.

STATISTICS

Mean, Median, and Mode

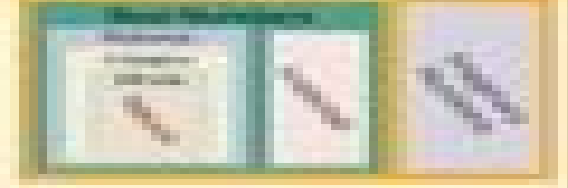

The mean is the average of a set of numbers. The median is the middle number of a set of numbers. The mode is the number that appears most often in a set of numbers.

Mean, median, and mode are used to describe the center of a distribution of data. They are also used to compare different distributions of data.

For example, the mean of a set of numbers can be used to determine the average value of the numbers. The median of a set of numbers can be used to determine the middle value of the numbers. The mode of a set of numbers can be used to determine the most common value of the numbers.

Mean, median, and mode are also used to solve problems involving real-world data. For example, the mean of a set of numbers can be used to determine the average value of the numbers, and the median of a set of numbers can be used to determine the middle value of the numbers.
