Topological Quantum Field Theory and Four Manifolds Jose Labastida, Marcos Marino, 2005-02-14 The emergence of topological quantum field theory has been one of the most important breakthroughs which have occurred in the context of mathematical physics in the last century a century characterized by independent developments of the main ideas in both disciplines physics and mathematics which has concluded with two decades of strong interaction between them where physics as in previous centuries has acted as a source of new mathematics Topological quantum field theories constitute the core of these phenomena although the main driving force behind it has been the enormous effort made in theoretical particle physics to understand string theory as a theory able to unify the four fundamental interactions observed in nature These theories set up a new realm where both disciplines profit from each other Although the most striking results have appeared on the mathematical side theoretical physics has clearly also benefited since the corresponding developments have helped better to understand aspects of the fundamentals of field and string theory

Mathematical Physics in Mathematics and Physics Roberto Longo, 2001 The beauty and the mystery surrounding the interplay between mathematics and physics is captured by E Wigner's famous expression The unreasonable effectiveness of mathematics We don't know why but physical laws are described by mathematics and good mathematics sooner or later finds applications in physics often in a surprising way In this sense mathematical physics is a very old subject as Egyptian Phoenician or Greek history tells us But mathematical physics is a very modern subject as any working mathematician or physicist can witness It is a challenging discipline that has to provide results of interest for both mathematics and physics Ideas and motivations from both these sciences give it a vitality and freshness that is difficult to find anywhere else One of the big physical revolutions in the twentieth century quantum physics opened a new magnificent era for this interplay With the appearance of noncommutative analysis the role of classical calculus has been taken by commutation relations a subject still growing in an astonishing way A good example where mathematical physics showed its power beauty and interdisciplinary character is the Doplicher Haag Roberts analysis of superselection sectors in the late 1960s Not only did this theory explain the origin of statistics and classify it but year after year new connections have merged for example with Tomita Takesaki modular theory Jones theory of subfactors and Doplicher Roberts abstract duality for compact groups This volume contains the proceedings of the conference Mathematical Physics in Mathematics and Physics dedicated to Sergio Doplicher and John E Roberts held in Siena Italy The articles offer current research in various fields of mathematical physics primarily concerning quantum aspects of operator algebras

this book is to explain in a basic manner the seemingly difficult issues of mathematical structure using some specific examples as a guide In each of the cases considered a comprehensible physical problem is approached to which the corresponding mathematical scheme is applied its usefulness being duly demonstrated The authors try to fill the gap that always exists between the physics of quantum field theories and the mathematical methods best suited for its formulation which are increasingly demanding on the mathematical ability of the physicist Contents Survey of Path Integral Quantization and Regularization Techniques The Zeta Function Regularization Method Generalized Spectra and Spectral Functions on Non Commutative Spaces Spectral Functions of Laplace Operator on Locally Symmetric Spaces Spinor Fields Field Fluctuations and Related Variances The Multiplicative Anomaly Applications of the Multiplicative Anomaly The Casimir Effect Readership Mathematical and high energy physicists **Aspects of Quantum Field Theory in Curved Spacetime**

Stephen A. Fulling, 1989-08-24 The theory of quantum fields on curved spacetimes has attracted great attention since the discovery by Stephen Hawking of black hole evaporation It remains an important subject for the understanding of such contemporary topics as inflationary cosmology quantum gravity and superstring theory This book provides for mathematicians an introduction to this field of physics in a language and from a viewpoint which such a reader should find congenial Physicists should also gain from reading this book a sound grasp of various aspects of the theory some of which have not been particularly emphasised in the existing review literature The topics covered include normal mode expansions for a general elliptic operator Fock space the Casimir effect the Klein paradox particle definition and particle creation in expanding universes asymptotic expansion of Green s functions and heat kernels and renormalisation of the stress tensor The style is pedagogic rather than formal some knowledge of general relativity and differential geometry is assumed but the

author does supply background material on functional analysis and quantum field theory as required The book arose from a course taught to graduate students and could be used for self study or for advanced courses in relativity and quantum field theory
