Renal Cancer Jack H. Mydlo, 2008-02-02 The purpose of *Renal Cancer Methods and Protocols* is to introduce the surgeon clinician investigator and research scientist to the basic methods employed in the diagnosis and treatment of renal cancer Treatment of localized renal cancer is surgical Treatment of metastasis with resection radiotherapy chemotherapy and immunotherapy has had limited results Therefore new avenues of treatment are necessary In planning this work I have attempted to incorporate coverage by specialists from a variety of disciplines each applying their individual expertise in renal cancer therapy Though many of the participating authors are urologists there are also valuable contributions from medical oncologists laboratory investigators and pathologists One of the inherent problems in publishing a book that describes molecular techniques especially those techniques that are rapidly evolving is that some of these may become obsolete after a few years However many of the procedures detailed here are standard approaches that have already withstood the test of time Reverse transcriptase PCR or RT PCR a technique that produces multiple copies of selected sequences of DNA has a sensitivity of a millionfold amplification of a single cell and thus constitutes a very precise technique for measuring the presence of tumor cells By combining this technique with genomic hybridization cadherin and metalloproteinase expression we may then reveal other important factors in the detection staging aggressiveness and treatment of this disease **Adult**
