Inelastic Analysis of Solids and Structures M. Kojic, Klaus-Jurgen Bathe, 2005-07-28 Inelastic Analysis of Solids and Structures presents in a unified manner the physical and theoretical background of inelastic material models and computational methods and illustrates the behavior of the models in typical engineering conditions The book describes experimental observations and principles of mechanics and efficient computational algorithms for stress calculations as typically performed in finite element analysis The theoretical background is given to an extent necessary to describe the commonly employed material models in metal isotropic and orthotropic plasticity thermoplasticity and viscoplasticity and the plasticity of geological materials The computational algorithms are developed in a unified manner with some detailed derivations of the algorithmic relations Many solved examples are presented which are designed to give insight into the material behavior in various engineering conditions and to demonstrate the application of the computational algorithms

Inelastic Analysis of Structures under Variable Loads Dieter Weichert, Giulio Maier, 2000-10-31 The question whether a structure or a machine component can carry the applied loads and with which margin of safety or whether it will become unserviceable due to collapse or excessive inelastic deformations has always been a major concern for civil and mechanical engineers The development of methods to answer this technologically crucial question without analysing the evolution of the system under varying loads has a long tradition that can be traced back even to the times of emerging mechanical sciences in the early 17th century However the scientific foundations of the theories underlying these methods nowadays frequently called direct were established sporadically in the Thirties of the 20th century and systematically and rigorously in the Fifties Further motivations for the development of direct analysis techniques in applied mechanics of solids and structures arise from the circumstance that in many engineering situations the external actions fluctuate according to time histories not a priori known except for some essential features e g variation intervals In such situations the critical events or limit states to consider besides plastic collapse are incremental collapse or ratchetting and alternating plastic yielding namely lack of shakedown Non evolutionary direct methods for ultimate limit state analysis of structures subjected to variably repeated external actions are the objectives of most papers collected in this book which also contains a few contributions on related topics

Computational procedures in inelastic analysis of solids and structures Miloš Kojić, 1997 **Computational Algorithms in Inelastic Analysis of Solids and Structures** Milos Kojic, 1994 *Inelastic Analysis of Structures under Variable Loads* Dieter Weichert, Giulio Maier, 2012-12-06

The question whether a structure or a machine component can carry the applied loads and with which margin of safety or whether it will become unserviceable due to collapse or excessive inelastic deformations has always been a major concern for civil and mechanical engineers. The development of methods to answer this technologically crucial question without analysing the evolution of the system under varying loads has a long tradition that can be traced back even to the times of emerging mechanical sciences in the early 17th century. However the scientific foundations of the theories underlying these methods nowadays frequently called direct were established sporadically in the Thirties of the 20th century and systematically and rigorously in the Fifties. Further motivations for the development of direct analysis techniques in applied mechanics of solids and structures arise from the circumstance that in many engineering situations the external actions fluctuate according to time histories not a priori known except for some essential features e.g. variation intervals. In such situations the critical events or limit states to consider besides plastic collapse are incremental collapse or ratchetting and alternating plastic yielding namely lack of shakedown. Non evolutionary direct methods for ultimate limit state analysis of structures subjected to variably repeated external actions are the objectives of most papers collected in this book which also contains a few contributions on related topics.
