1454 TURBOCHARGING

The turbocharging system consists of:

- air filter
- variable geometry turbocharger
- "intercooler" radiator.

TURBOCHARGER

Operating principle

The variable geometry turbocharger (VGT) consists of a variable geometry compressor and a variable geometry turbine, with a variable device which adjusts the area of the passing section of the turbine.

Thanks to this system, the turbine wheel can be kept away from the compressor wheel.

When gas flow is low, narrow passages in both turbine wheels cause the turbine to rotate more slowly.

The movement of the device, allowing the exhaust gas flowing section, is carried out by a mechanism, actuated by a pneumatic actuator.

This actuator is directly controlled by the electronic control unit and by a proportional solenoid valve.

The device is in maximum closing condition at low speed. At high engine operating speeds, the electronic control system is activated and increases the passing section, in order to allow the increasing gas flow without reducing their speed.

A bypass chamber is obtained during the closing process in the turbine body for the passage of the exhaust.
