

Operating Systems test 1 Questions and Answers

1.1 In a multiprogramming and time-sharing environment several users share the system simultaneously. This situation can result in various security problems.

What are two such problems? - answerStealing or copying one's programs or data using system resources (memory, disk space, peripherals) without proper accounting.

a. Can we ensure the same degree of security in a time-shared machine as in a dedicated machine? Explain your answer. - answersince any protection scheme devised by humans can inevitably be broken by a human, and the more complex the scheme, the more difficult it is to feel confident of its correct implementation.

1.10 What is the purpose of interrupts? - answerMeans of moving from moving one process to another. Allows multiple processes to occur simultaneously by allowing transfer of control between system processes and I/O. Cause switching to kernel mode.

What are the differences between a trap and an interrupt? - answerTrap (or exception) is a software-generated interrupt caused either by an error (division by zero or invalid memory access) or by a specific request from the user program that an operating-system service be performed. Interrupts triggered by signal from either hardware or software but not tied to any specific instruction.

Can traps be generated intentionally by a user program? ... If so for what purpose? - answerThrough exception or explicit call... an interrupt causes system to go into privilege mode (kernel mode).

An interrupt is a hardware-generated change-of-flow within the system. An interrupt handler is called to deal with the cause of the interrupt control is then returned to the interrupted context and instruction.

What are the differences between a trap and an interrupt? - answerA trap is a software-generated interrupt. An interrupt can be used to signal the completion of an I/O to eliminate the need for device polling.
