A Management-oriented Classification of Pinyon-Juniper Woodlands of the Great Basin Neil E. West, Robin J. Tausch, Paul T. Tueller, 1998 A hierarchical framework for the classification of Great Basin pinyon juniper woodlands was based on a systematic sample of 426 stands from a random selection of 66 of the 110 mountain ranges in the region That is mountain ranges were randomly selected but stands were systematically located on mountain ranges The National Hierarchical Framework of Ecological Units ECOMAP was used for the highest levels of classification subdividing the Great Basin into nine relatively environmentally homogeneous Sections The remaining levels are vegetation based focusing on the relative composition and dominance of pinyon and juniper and the dominant shrub and perennial grass species present This

approach will allow managers to better relate the results of previous as well as new studies and management experiences

Bilek, 2009 This documentation is meant to accompany CVal a downloadable spreadsheet tool CVal was constructed for foresters other land management advisors landowners and carbon credit aggregators to evaluate the direct benefits and costs of entering into contracts for carbon sequestered in managed forests and forest plantations CVal was designed to evaluate Exchange Forestry Offset XFO contracts on the Chicago Climate Exchange CCX although the methodology could be adapted for other trading mechanisms and agricultural sequestration projects Both the documentation

and the spreadsheet tool are downloadable from http://www.fpl.fs.fed.us/documnts/fplgtr/fpl_gtr180/fpl_gtr180.html Versions of CVal are available both with and without macros. Although all calculations can be done in the version without macros, the macros version has buttons and automations that make the calculations convenient. Our general finding is that it is critical in managed forest projects to determine whether carbon accumulated prior to entering the contract can be counted. Depending on the contract year and length, this can triple the revenue from CCX contracts. If it is not possible to count pre-contract year carbon, then it may not be economically worthwhile to enter the program unless it is extended. Other critical variables having a large effect on the overall profitability include the trade price of sequestered carbon, the carbon sequestration rate, and the hurdle rate. The minimum required rate of return on investment used up front and annual costs are important, but overall profitability is not quite as sensitive to these costs as it is to the previously mentioned variables. Users are expected to enter their own data to evaluate the feasibility of specific projects.
