

5. Operation

6 - Operation at low temperatures - 0° C (32° F) and below

Recommendations

- 1- Make sure the engine coolant has the proper anti-freeze mixture to protect from anticipated low temperatures. Follow the proportion recommended by the product manufacturer (see the table of products recommended by AGCO - Maintenance section).
- 2- Use No. 1 grade diesel fuel. This is specially formulated to avoid formation of paraffin which clogs fuel lines and filters.
- 3- Use engine lubricants with suitable viscosity according to the temperature at which the tractor will be operating. Normally, classification API-CE SAE15W-40 meets all requirements. Contact your supplier for further information.
- 4- Always keep the battery charged and the electrical system in good condition.
- 5- Keep the radiator cap and the thermostat valve in perfect condition. These items are essential to the cooling system has a proper performance (see the Maintenance section for detailed information).

Turbocharged engines

The turbocharger consists of two parts: turbine and compressor.

The turbine receives air through the filter and sends it with increased pressure out to the engine cylinders.

Therefore, turbocharged engines will hardly have their performance impaired at high altitudes, as the turbocharger automatically offsets pressure reduction by increasing rotation speed.

NOTE:

The performance of turbocharged engines is not impaired at high altitudes, as mentioned above.

However, problems with cooling are the same as those presented by natural aspiration engines. Therefore, it is important to follow maintenance instructions!

5. Operation

7 - Front drive operation

The four-wheel drive engagement provides increased traction efficiency, that is, increased traction force is obtained with the same engine power.

Traction must be used for operations that require tractive force, such as slope and pulling of heavy trailers. Do not engage the four-wheel drive while driving on roads or highways or in light operations that do not require tractive force.

The 4WD front axle differential incorporated a mechanism that distributes torque to the wheels automatically.

This reduces slippage considerably, without the operator's interference, resulting in increased tractive force, reduced tire wear and improved efficiency.

This feature is essential mainly in situations where wheel adhesion with the ground is not the same on both sides. In this situation, the torque distribution system starts a locking action of up to 40%, which is sufficient to maintain the tractor conditions used during normal tractor operation.

4WD front axle engagement

Front-wheel drive transmission greatly improves traction in difficult conditions.

The tractor is equipped with a mechanical type of engagement. The drive to the front axle must only be engaged and disengaged with the tractor stationary. Attempting to engage while moving can result in internal damage.

To engage the four-wheel drive front axle:

For all cab tractor versions - Fig. 146

Push the lever downward.

To disengage the front drive, always depress the clutch pedal, stop the tractor and pull the lever upward.

For all footstep tractor version - Fig. 148

Move the lever forward.

To disengage the front drive, always depress the clutch pedal, stop the tractor and move the lever backward.
