## **Information Dynamics Foundations And Applications:**

Information Dynamics Gustavo Deco, Bernd Schürmann, 2012-09-08 This book offers a new theoretical approach to information dynamics i.e. information processing in complex dynamical systems. The presentation establishes a consistent theoretical framework for the problem of discovering knowledge behind empirical dynamical data and addresses applications in information processing and coding in dynamical systems. This will be an essential reference for those in neural computing, information theory, nonlinear dynamics, and complex systems modeling.

**The Theory of Info-Dynamics: Rational Foundations of Information-Knowledge Dynamics** Kofi K. Dompere, 2017-12-06 This book focuses on the development of a theory of info dynamics to support the theory of info statics in the general theory of information. It establishes the rational foundations of information dynamics and how these foundations relate to the general socio-natural dynamics from the primary to the derived categories in the universal existence and from the potential to the actual in the ontological space. It also shows how these foundations relate to the general socio-natural dynamics from the potential to the possible to give rise to the possibility space with possibilistic thinking from the possible to the probable to give rise to possibility space with probabilistic thinking and from the probable to the actual to give rise to the space of knowledge with paradigms of thought in the epistemological space. The theory is developed to explain the general dynamics through various transformations in quality-quantity space in relation to the nature of information flows at each variety transformation. The theory explains the past-present-future connectivity of the evolving information structure in a manner that illuminates the transformation problem and its solution in the never-ending information production within matter-energy space under socio-natural technologies to connect the theory of info statics which in turn presents explanations to the transformation problem and its solution. The theoretical framework is developed with analytical tools based on the principle of opposites, systems of actual-potential polarities, negative-positive dualities under different time structures with the use of category theory, fuzzy paradigm of thought, and game theory in the fuzzy stochastic cost-benefit space. The rational foundations are enhanced with categorical analytics. The value of the theory of info dynamics is demonstrated in the explanatory and prescriptive structures of the transformations of varieties and categorical varieties at each point of time and over time from parent-offspring sequences. It constitutes a general explanation of dynamics of information-knowledge production through info processes and info processors induced by a socio-natural infinite set of technologies in the construction-destruction space.

**Information Dynamics in Cognitive, Psychological, Social, and Anomalous Phenomena** Andrei Ilyich Khrennikov, 2004-02-29 This book develops a new physical-mathematical model for the functioning of the human brain based not on the modern Newton-Einstein view of physical reality but on information reality. The work is devoted to the physical-mathematical modeling of conscious cognitive phenomena. The most important distinguishing feature of the theory presented here is a new model of mental space: the so-called  $p$ -adic hierarchical tree space and the development of mental analogs of classical and

quantum mechanics Mental processes and more general information processes are handled as a kind of new physical processes In particular the procedure of information quantization and an information analog of Bohmian mechanics are developed Here mind is a singularity in the mental pilot wave Applications to neurophysiology localization of mental function and brain ablations and psychology in particular Freud's psychoanalysis are considered Audience This book will be of interest to researchers working on physical mathematical cognitive neurophysical psychological and philosophical aspects of human consciousness

**Digital And The Real World, The: Computational Foundations Of Mathematics, Science, Technology, And Philosophy** Klaus Mainzer, 2017-11-17 In the 21st century digitalization is a global challenge of mankind Even for the public it is obvious that our world is increasingly dominated by powerful algorithms and big data But how computable is our world Some people believe that successful problem solving in science technology and economies only depends on fast algorithms and data mining Chances and risks are often not understood because the foundations of algorithms and information systems are not studied rigorously Actually they are deeply rooted in logics mathematics computer science and philosophy Therefore this book studies the foundations of mathematics computer science and philosophy in order to guarantee security and reliability of the knowledge by constructive proofs proof mining and program extraction We start with the basics of computability theory proof theory and information theory In a second step we introduce new concepts of information and computing systems in order to overcome the gap between the digital world of logical programming and the analog world of real computing in mathematics and science The book also considers consequences for digital and analog physics computational neuroscience financial mathematics and the Internet of Things IoT

*Johan van Benthem on Logic and Information Dynamics* Alexandru Baltag, Sonja Smets, 2014-08-27 This book illustrates the program of Logical Informational Dynamics Rational agents exploit the information available in the world in delicate ways adopt a wide range of epistemic attitudes and in that process constantly change the world itself Logical Informational Dynamics is about logical systems putting such activities at center stage focusing on the events by which we acquire information and change attitudes Its contributions show many current logics of information and change at work often in multi agent settings where social behavior is essential and often stressing Johan van Benthem's pioneering work in establishing this program However this is not a Festschrift but a rich tapestry for a field with a wealth of strands of its own The reader will see the state of the art in such topics as information update belief change preference learning over time and strategic interaction in games Moreover no tight boundary has been enforced and some chapters add more general mathematical or philosophical foundations or links to current trends in computer science The theme of this book lies at the interface of many disciplines Logic is the main methodology but the various chapters cross easily between mathematics computer science philosophy linguistics cognitive and social sciences while also ranging from pure theory to empirical work Accordingly the authors of this book represent a wide variety of original thinkers from different research communities And their interconnected themes

challenge at the same time how we think of logic philosophy and computation Thus very much in line with van Benthem's work over many decades the volume shows how all these disciplines form a natural unity in the perspective of dynamic logicians broadly conceived exploring their new themes today And at the same time in doing so it offers a broader conception of logic with a certain grandeur moving its horizons beyond the traditional study of consequence relations

**Adaptive and Natural Computing Algorithms** Andrej Dobnikar, Uroš Lotric, Branko Šter, 2011-04-09 The two volume set LNCS 6593 and 6594 constitutes the refereed proceedings of the 10th International Conference on Adaptive and Natural Computing Algorithms ICANNGA 2010 held in Ljubljana Slovenia in April 2010 The 83 revised full papers presented were carefully reviewed and selected from a total of 144 submissions The first volume includes 42 papers and a plenary lecture and is organized in topical sections on neural networks and evolutionary computation

Modeling Communication with Robots and Virtual Humans Ipke Wachsmuth, Günther Knoblich, 2008-04-03 Embodied agents play an increasingly important role in cognitive interaction technology The two main types of embodied agents are virtual humans inhabiting simulated environments and humanoid robots inhabiting the real world So far research on embodied communicative agents has mainly explored their potential for practical applications However the design of communicative artificial agents can also be of great heuristic value for the scientific study of communication It allows researchers to isolate implement and test essential properties of inter agent communications in operational models Modeling communication with robots and virtual humans thus involves the vision of using communicative machines as research tools Artificial systems that reproduce certain aspects of natural multimodal communication help to elucidate the internal mechanisms that give rise to different aspects of communication In short constructing embodied agents who are able to communicate may help us to understand the principles of human communication As a comprehensive theme Embodied Communication in Humans and Machines was taken up by an international research group hosted by Bielefeld University's Center for Interdisciplinary Research ZiF Zentrum für

interdisziplinäre Forschung from October 2005 through September 2006 The overarching goal of this research year was to develop an integrated perspective of embodiment in communication establishing bridges between lower level sensorimotor functions and a range of higher level communicative functions involving language and bodily action The present volume grew out of a workshop that took place during April 5-8 2006 at the ZiF as a part of the research year on embodied communication

Thinking in Complexity Klaus Mainzer, 2007-09-07 The theory of nonlinear complex systems has become by now a proven problem solving approach in the natural sciences And it is now also recognized that many if not most of our social ecological economical and political problems are essentially of a global complex and nonlinear nature And it is now further accepted than any holistic perspective of the human mind and brain can hardly be achieved by any other approach In this wide ranging scholarly but very concise treatment physicist computer scientist and philosopher Klaus Mainzer discusses in essentially nontechnical language the common framework behind these ideas and challenges Emphasis is given to the evolution of new structures in natural and cultural systems and we are lead to see clearly how the new integrative approach can give insights not available from traditional reductionistic methods The fifth edition enlarges and revises almost all sections and supplements an entirely new chapter on the complexity of economic systems From the reviews of the fourth edition this highly recommended book is a wonderful resource for intuitive basic ideas in the need of rigorous
