Glenner,2012-12-06 From a process that from the days of Virchow and Rokitansky primarily stimulated the relatively narrow interest of pathologists amyloidosis has risen full blown as one of the most important of disease complexes Its presence dominates the lesions of Alzheimer's disease a disease affecting an estimated 2.5 million people in the U.S.A and thereby closely rivaling stroke as the third most common cause of death If as it has been described Alzheimer's disease is the Disease of the Century then amyloidosis is the Disease Complex of the Ages It affects in one or more of its manifestations every organ of the body and is at least as old as the afflicted Egyptian mummies of the pyramids With an increasing percentage of older individuals amyloid of the senior population becomes increasingly more frequent The subjects covered in this Symposium range through almost every clinical medical specialty From an average of one paper in each of the past three Symposiums the explosive interest in cerebral amyloidosis has led to the presentation of 12 papers on this subject in the present volume The genetically predisposed familial amyloidotic processes such as the polyneuropathies and familial Mediterranean fever have also stimulated extensive and intriguing investigations which have revealed the striking effect of a single amino acid substitution in transforming a normal protein into a lethal amyloidogenic one **Liquid**

Synthesis and Analytics of Rigidified Peptide Architectures. Neuropeptide Y Dipeptide Scan Ring-Chain-Equilibria of Imino-peptides Thiazole Amino Acids for Thiopeptide Antibiotics Sebastian Enck, 2010 The architectures three dimensional shapes of peptides determine their respective biological functions Therefore the correct alignment of functionalities in a structure by constraining the flexibility is a key process in evolution as well as in medicinal chemistry in order to increase binding affinity and selectivity The rigidification of a peptide chain can have local effects incorporation of the amino acid proline or it can globally restrain flexibility macrocyclization Furthermore the combination of both strategies has given rise to complex antibiotics with highly optimized modes of action This work approaches these principles in three topics and for different purposes The first chapter presents a novel scanning strategy which utilizes synthetic local rigidifications for the evaluation of Neuropeptide Y structure and receptor binding patterns The fundamental process of macrocyclization is topic of the second chapter For imino-peptides ring chain equilibria can be established and controlled thereby allowing for the thermodynamic analysis of the ring closure This leads to the identification of structural determinants that influence the inclination of a peptide chain to close the ring In the third chapter a sugarbased synthetic pathway leading to highly functionalized thiazole dipeptides is described This strategy led to the synthesis of core motifs of complex thiopeptide antibiotics as well as to diastereomers and homologs thereof
