The History of Life Michael J. Benton, 2008-11-27 There are few stories more remarkable than the evolution of life on earth. This Very Short Introduction presents a succinct guide to the key episodes in that story, from the very origins of life four billion years ago to the extraordinary diversity of species around the globe today. Beginning with an explanation of the controversies surrounding the birth of life itself, each following chapter tells of a major breakthrough that made new forms of life possible, including sex and multicellularity, hard skeletons, and the move to land. Along the way, we witness the greatest mass extinction, the first forests, the rise of modern ecosystems, and most recently, conscious humans. Introducing ideas from a range of scientific disciplines, from evolutionary biology and earth history to geochemistry, palaeontology, and systematics, Michael Benton explains how modern science pieces the evidence in this vast evolutionary puzzle together to build up an accessible and up-to-date picture of the key developments in the history of life on earth.

Third ever since Darwin we have thought of evolution in terms of species Yet it is the evolution of ecosystems from deep ocean vents to rainforests that has formed the living world as we know it Ward and Kirschvink tell a story of life on Earth that is at once fabulous and familiar And in a provocative coda they assemble discoveries from the latest cutting edge research to imagine how the history of life might unfold deep into the future *Planetary and Interstellar Processes Relevant to the Origins of Life* D.C.B. Whittet, 2013-03-14 These are exciting times for exobiology The ubiquity of organic molecules in interstellar clouds comets and asteroids strongly supports a cosmic perspective on the origin of life Data from both ground based telescopes and the recently launched Infrared Space Observatory are providing new insight into the complexity of carbon based chemistry beyond the Earth Meteorites give us solid evidence for extraterrestrial amino acids and putative fossil evidence for life in a 3 6 billion year old Martian meteorite hints that life in our system might not be the sole prerogative of the Earth Giant planets have now been discovered orbiting other stars and although such planets seem unlikely to be habitable themselves their existence strongly suggests what many astronomers have long believed that planetary systems are commonplace All these topics are reviewed in this volume by active researchers The level is appropriate for graduate students in astronomy biology chemistry earth sciences physics and related disciplines It will also provide a valuable source of reference for active researchers in these fields *Campbell Biology Australian and New Zealand Edition* Jane B.
