Science SOL 4.2- Plants & Animals

Deliverable: "Students will explain how different processes and structures help plants to carry out photosynthesis and reproduction."

Plants are composed of parts that function together to carry out life processes such as taking in water and nutrients.

Root Systems
 The roots of a plant are the parts that anchor the plant in the soil and absorb water and nutrients. They are also responsible for storing food. The root system is divided into two main parts: the taproot and the fibrous root system.

- Taproots are the main roots that grow straight down into the soil.
- Fibrous roots are a network of roots that grow out from the base of the plant.
- Both types of roots absorb water and nutrients from the soil.
- Taproots also store food for the plant.
- Fibrous roots help the plant to stand upright.

Stem
 The stem is the part of the plant that supports the leaves and flowers. It also transports water and nutrients from the roots to the leaves and flowers. The stem is divided into two main parts: the main stem and the branches.

Leaves
 Leaves are the parts of the plant that carry out photosynthesis. They are also responsible for transpiration, the process of losing water vapor from the leaves. The leaf is divided into two main parts: the blade and the petiole.

Flowers
 Flowers are the parts of the plant that reproduce. They are also responsible for the production of seeds. The flower is divided into two main parts: the male part (stamen) and the female part (pistil).
