optimization problems in various fields **Exploring New Frontiers of Theoretical Informatics** Jean-Jacques Lévy, Ernst W. Mayr, John C. Mitchell, 2004-07-27 In recent years IT application scenarios have evolved in very innovative ways Highly distributed networks have now become a common platform for large scale distributed programming high bandwidth communications are inexpensive and widespread and most of our work tools are equipped with processors enabling us to perform a multitude of tasks In addition mobile computing referring specifically to wireless devices and more broadly to dynamically configured systems has made it possible to exploit interaction in novel ways To harness the flexibility and power of these rapidly evolving interactive systems there is need of radically new foundational ideas and principles there is need to develop the theoretical foundations required to design these systems and to cope with the many complex issues involved in their construction and there is need to develop effective principles for building and analyzing such systems Reflecting the diverse and wide spectrum of topics and interests within the theoretical computer science community Exploring New Frontiers of Theoretical Informatics is presented in two distinct but interrelated tracks Algorithms Complexity and Models of Computation Logic Semantics Specification and Verification Exploring New Frontiers of Theoretical Informatics contains 46 original and significant contributions addressing these foundational questions as well as 4 papers by outstanding invited speakers These papers were presented at the 3rd IFIP International Conference on Theoretical Computer Science TCS 2004 which was held in conjunction with the 18th World Computer Congress in Toulouse France in August 2004 and sponsored by the International Federation for Information Processing IFIP *Handbook on Modelling for Discrete Optimization* Gautam M. Appa, Leonidas Pitsoulis, H. Paul Williams, 2006-08-18 The primary reason for producing this book is to demonstrate and communicate the pervasive nature of Discrete Optimisation It has applications across a very wide range of activities Many of the applications are only known to specialists Our aim is to rectify this It has long been recognized that modelling is as important if not more important a mathematical activity as designing algorithms for solving these discrete optimisation problems Nevertheless solving the resultant models is also often far from straightforward Although in recent years it has become viable to solve many large scale discrete optimisation problems some problems remain a challenge even as advances in mathematical methods hardware and software technology are constantly pushing the frontiers forward The subject brings together diverse areas of academic activity as well as diverse areas of applications To date the driving force has been Operational Research and Integer Programming as the major extension of the well developed subject of Linear Programming However the subject also brings results in Computer Science Graph Theory Logic and Combinatorics all of which are reflected in this book We have divided the chapters in this book into two parts one dealing with general methods in the modelling of discrete optimisation problems and one with specific applications The first chapter of this volume written by Paul Williams can be regarded as a basic introduction of how to model discrete optimisation problems as Mixed Integer Programmes and outlines the main methods of solving them Multimodal Transport Systems Slim Hammadi, Mekki

Ksouri,2013-12-11 The use and management of multimodal transport systems including car pooling and goods transportation have become extremely complex due to their large size sometimes several thousand variables the nature of their dynamic relationships as well as the many constraints to which they are subjected The managers of these systems must ensure that the system works as efficiently as possible by managing the various causes of malfunction of the transport system vehicle breakdowns road obstructions accidents etc The detection and resolution of conflicts which are particularly complex and must be dealt with in real time are currently processed manually by operators However the experience and abilities of these operators are no longer sufficient when faced with the complexity of the problems to be solved It is thus necessary to provide them with an interactive tool to help with the management of disturbances enabling them to identify the different disturbances to characterize and prioritize these disturbances to process them by taking into account their specifics and to evaluate the impact of the decisions in real time Each chapter of this book can be broken down into an approach for solving a transport problem in 3 stages i e modeling the problem creating optimization algorithms and validating the solutions The management of a transport system calls for knowledge of a variety of theories problem modeling tools multi objective problem classification optimization algorithms etc The different constraints increase its complexity drastically and thus require a model that represents as far as possible all the components of a problem in order to better identify it and propose corresponding solutions These solutions are then evaluated according to the criteria of the transport providers as well as those of the city transport authorities This book consists of a state of the art on innovative transport systems as well as the possibility of coordinating with the current public transport system and the authors clearly illustrate this coordination within the framework of an intelligent transport system *Column Generation* Guy Desaulniers,Jacques Desrosiers,Marius M.

Solomon,2006-03-20 *Column Generation* is an insightful overview of the state of the art in integer programming column generation and its many applications The volume begins with A Primer in Column Generation which outlines the theory and ideas necessary to solve large scale practical problems illustrated with a variety of examples Other chapters follow this introduction on Shortest Path Problems with Resource Constraints Vehicle Routing Problem with Time Window Branch and Price Heuristics Cutting Stock Problems each dealing with methodological aspects of the field Three chapters deal with transportation applications Large scale Models in the Airline Industry Robust Inventory Ship Routing by Column Generation and Ship Scheduling with Recurring Visits and Visit Separation Requirements Production is the focus of another three chapters Combining Column Generation and Lagrangian Relaxation Dantzig Wolfe Decomposition for Job Shop Scheduling and Applying Column Generation to Machine Scheduling The final chapter by Francois Vanderbeck Implementing Mixed Integer Column Generation reviews how to set up the Dantzig Wolfe reformulation adapt standard MIP techniques to the column generation context branching preprocessing primal heuristics and deal with specific column generation issues initialization stabilization column management strategies **Proceedings of the Sixth International Forum on Decision**
