Hard Real Time Computing Systems Predictable Scheduling Algorithms And Applications Real Time Systems Series:

Hard Real-Time Computing Systems Giorgio C Buttazzo, 2007-08-19 Real time computing plays a crucial role in our society since an increasing number of complex systems rely in part or completely on processor control. Examples of applications that require real time computing include nuclear power plants, railway switching systems, automotive electronics, air traffic control, telecommunications, robotics, and military systems. In spite of this large application domain, most of the current real time systems are still designed and implemented using low level programming and empirical techniques without the support of a scientific methodology. This approach results in a lack of reliability which in critical applications may cause serious environmental damage or even loss of life. This book is a basic treatise on real time computing with particular emphasis on predictable scheduling algorithms. The main objectives of the book are to introduce the basic concepts of real time computing, illustrate the most significant results in the field, and provide the basic methodologies for designing predictable computing systems useful in supporting critical control applications. The book is written for instructional use and is organized to enable readers without a strong knowledge of the subject matter to quickly grasp the material. Technical concepts are clearly defined at the beginning of each chapter and algorithm descriptions are reinforced through concrete examples, illustrations, and tables.

Hard Real-Time Computing Systems Giorgio Buttazzo, 2010-12-01 *Hard Real Time Computing Systems Predictable Scheduling Algorithms and Applications* is a basic treatise on real time computing with particular emphasis on predictable scheduling algorithms. It introduces the fundamental concepts of real time computing, illustrates the most significant results in the field, and provides the essential methodologies for designing predictable computing systems which can be used to support critical control applications. This volume serves as a textbook for advanced level courses on the topic. Each chapter provides basic concepts which are followed by algorithms that are illustrated with concrete examples, figures, and tables. Exercises are included with each chapter and solutions are given at the end of the book. The book also provides an excellent reference for those interested in real time computing for designing and/or developing predictable control applications.
