C++ Toolkit for Engineers and Scientists James T. Smith, 2013-03-09 This

book describes the design construction and use of a numerical analysis software toolkit It s written in C Version 2 0 and makes essential use of that language s Object Oriented Programming OOP features Its development environment is the Borland International Inc Borland C compiler Version 5 02 for IBM compatible personal computers However the book describes few features specific to that product The toolkit and its description and background discussions cover the most fundamental aspects of numerical analysis At the core of most scientific or engineering application programs are some of the concepts and techniques presented here The most basic include details of computation with floating point real and complex numbers mathematical functions in the C Library and a general OOP framework for vector polynomial and matrix algebra On this foundation routines are constructed for solving nonlinear equations linear and nonlinear systems of equations and eigenvalue problems The book is heavily weighted toward software development What s new here is the emphasis on software tools and on OOP techniques for handling vectors polynomials and matrices Rather than describing programs implementing specific numerical techniques to solve specific application problems the book constructs reusable tools with which you can implement many techniques for solving broad classes of problems Examples are included to demonstrate their use The tools are organized into layers The deepest is formed by the C library functions for computing with real and complex numbers A list of errata can be found on the author s personal webpage

Explorations in Mathematical Physics Don Koks, 2006-11-30 Have you ever wondered why the language of modern physics centres on geometry Or how quantum operators and Dirac brackets work What a convolution really is What tensors are all about Or what field theory and lagrangians are and why gravity is described as curvature This book takes you on a tour of the main ideas forming the language of modern mathematical physics Here you will meet novel approaches to concepts such as determinants and geometry wave function evolution statistics signal processing and three dimensional rotations You ll see how the accelerated frames of special relativity tell us about gravity On the journey you ll discover how tensor notation relates to vector calculus how differential geometry is built on intuitive concepts and how variational calculus leads to field theory You will meet quantum measurement theory along with Green functions and the art of complex integration and finally general relativity and cosmology The book takes a fresh approach to tensor analysis built solely on the metric and vectors with no need for one forms This gives a much more geometrical and intuitive insight into vector and tensor calculus together with general relativity than do traditional more abstract methods Don Koks is a physicist at the Defence Science and Technology Organisation in Adelaide Australia His doctorate in quantum cosmology was obtained from the Department of Physics and Mathematical Physics at Adelaide University Prior work at the University of Auckland specialised in applied accelerator physics along with pure and applied mathematics
