Limited electric power operates on low voltage, ranging from 11 to 115 volts. Limited transformers reduce or increase the available power voltage to the low voltage required. The plug at the end of the transformer cord is plugged into any standard wall outlet of 115 volts, 60 cycles alternating current. The low voltage the operating station and appliances is then obtained from the output terminals at the rear of the transformer.

The voltage rating of the "AC" Transformers is 220 volts. The voltage of a transformer is a measure of its capacity in ability to handle power. The ratings of the transformers are based on the number of turns and number of cycles and the number of cycles and operating conditions in your model railroad system. The larger the transformer and the greater the number of windings, the more power you need and the higher should be the voltage rating of the transformer.
