Fred Brauer,Carlos Castillo-Chavez,2011-11-09 The goal of this book is to search for a balance between simple and analyzable models and unsolvable models which are capable of addressing important questions on population biology Part I focusses on single species simple models including those which have been used to predict the growth of human and animal population in the past Single population models are in some sense the building blocks of more realistic models the subject of Part II Their role is fundamental to the study of ecological and demographic processes including the role of population structure and spatial heterogeneity the subject of Part III This book which will include both examples and exercises is of use to practitioners graduate students and scientists working in the field **Mathematical Models in**

Epidemiology Fred Brauer,Carlos Castillo-Chavez,Zhilan Feng,2019-10-10 The book is a comprehensive self contained introduction to the mathematical modeling and analysis of disease transmission models It includes i an introduction to the

main concepts of compartmental models including models with heterogeneous mixing of individuals and models for vector transmitted diseases ii a detailed analysis of models for important specific diseases including tuberculosis HIV AIDS influenza Ebola virus disease malaria dengue fever and the Zika virus iii an introduction to more advanced mathematical topics including age structure spatial structure and mobility and iv some challenges and opportunities for the future There are exercises of varying degrees of difficulty and projects leading to new research directions For the benefit of public health professionals whose contact with mathematics may not be recent there is an appendix covering the necessary mathematical background There are indications which sections require a strong mathematical background so that the book can be useful for both mathematical modelers and public health professionals An Introduction to Mathematical Epidemiology Maia Martcheva, 2015-10-20

Mathematical Structures of Epidemic Systems Vincenzo Capasso, 2008-08-06 The dynamics of infectious diseases

represents one of the oldest and richest areas of mathematical biology. From the classical work of Hamer 1906 and Ross 1911 to the state of more modern developments associated with Anderson and May, Dietz, Hethcote, Castillo-Chavez and others, the subject has grown dramatically both in volume and in importance. Given the pace of development, the subject has become more and more diverse and the need to provide a framework for organizing the diversity of mathematical approaches has become clear. Enzo Capasso, who has been a major contributor to the mathematical theory, has done that in the present volume, providing a system for organizing and analyzing a wide range of models depending on the structure of the interaction matrix. The first class, the quasi-monotone or positive feedback systems, can be analyzed effectively through the use of comparison theorems; that is, the theory of order-preserving dynamical systems. The second, the skew-symmetrizable systems, rely on Lyapunov methods. Capasso develops the general mathematical theory and considers a broad range of examples that can be treated within one or the other framework. In so doing, he has provided the first steps towards the unification of the subject and made an invaluable contribution to the *Lecture Notes in Biomathematics*. Simon A. Levin, Princeton, January 1993.

Author's Preface to Second Printing In the Preface to the First Printing of this volume, I wrote: [Oxford Textbook of Global Public Health](#) Roger Detels, Martin Gulliford, Quarraisha Abdool Karim, Chhorh Chuan Tan, 2017. Sixth edition of the hugely successful internationally recognised textbook on global public health and epidemiology, comprehensively covering the scope, methods and practice of the discipline. [Ecological Time Series](#) Thomas M. Powell, John H. Steele, 2012-12-06. This book results from a summer school held at Cornell University in 1992. The participants were graduate students and postdoctoral researchers selected from a broad range of interests and backgrounds in ecological studies. The summer school was the second in a continuing series whose underlying aim, and the aim of this volume, is to bring together the different methods and concepts underpinning terrestrial, freshwater and marine ecology. The first volume in the series focused on patch dynamics in these three ecological sectors. Here we have endeavored to complement that volume by extending its comparative approach to the consideration of ecological time series. The types of data and the methods of collection are necessarily very different in these contrasting environments, yet the underlying concept and the technical problems of analysis have much in common. It proved to be of great interest and value to the summer school participants to see the differences and then work through to an appreciation of the generalizable concepts. We believe that such an approach must have value as well for a much larger audience, and we have structured this volume to provide a comparable reading experience.

Dynamical Systems Zeraoulia Elhadj, 2019-01-21. Chaos is the idea that a system will produce very different long-term behaviors when the initial conditions are perturbed only slightly. Chaos is used for novel time or energy-critical interdisciplinary applications. Examples include high-performance circuits and devices, liquid mixing, chemical reactions, biological systems, crisis management, secure information processing, and critical decision making in politics, economics, as well as military applications, etc. This book presents the latest investigations in the theory of chaotic systems and their dynamics. The book covers some theoretical

aspects of the subject arising in the study of both discrete and continuous time chaotic dynamical systems This book presents the state of the art of the more advanced studies of chaotic dynamical systems *Mathematical Approaches for Emerging and Reemerging Infectious Diseases: An Introduction* Carlos Castillo-Chavez, 2002-05-02 This book grew out of the discussions and presentations that began during the Workshop on Emerging and Reemerging Diseases May 17-21 1999 sponsored by the Institute for Mathematics and its Application IMA at the University of Minnesota with the support of NIH and NSF The workshop started with a two day tutorial session directed at ecologists epidemiologists immunologists mathematicians and scientists interested in the study of disease dynamics The core of this first volume Volume 125 covers tutorial and research contributions on the use of dynamical systems deterministic discrete delay PDEs and ODEs models and stochastic models in disease dynamics The volume includes the study of cancer HIV pertussis and tuberculosis Beginning graduate students in applied mathematics scientists in the natural social or health sciences or mathematicians who want to enter the fields of mathematical and theoretical epidemiology will find this book useful Mathematical Models for Communicable Diseases Fred Brauer, Carlos Castillo-Chavez, 2013-02-07 A self contained and comprehensive guide to the mathematical modeling of disease transmission appropriate for graduate students **Matrix Models for Population, Disease, and Evolutionary Dynamics** J. M. Cushing, 2024-02-29 This book offers an introduction to the use of matrix theory and linear algebra in modeling the dynamics of biological populations Matrix algebra has been used in population biology since the 1940s and continues to play a major role in theoretical and applied dynamics for populations structured by age body size or weight disease states physiological and behavioral characteristics life cycle stages or any of many other possible classification schemes With a focus on matrix models the book requires only first courses in multivariable calculus and matrix theory or linear algebra as prerequisites The reader will learn the basics of modeling methodology i e how to set up a matrix model from biological underpinnings and the fundamentals of the analysis of discrete time dynamical systems equilibria stability bifurcations etc A recurrent theme in all chapters concerns the problem of extinction versus survival of a population In addition to numerous examples that illustrate these fundamentals several applications appear at the end of each chapter that illustrate the full cycle of model setup mathematical analysis and interpretation The author has used the material over many decades in a variety of teaching and mentoring settings including special topics courses and seminars in mathematical modeling mathematical biology and dynamical systems *Analyzing and Modeling Spatial and Temporal Dynamics of Infectious Diseases* Dongmei Chen, Bernard Moulin, Jianhong Wu, 2014-12-08 Features modern research and methodology on the spread of infectious diseases and showcases a broad range of multi disciplinary and state of the art techniques on geo simulation geo visualization remote sensing metapopulation modeling cloud computing and pattern analysis Given the ongoing risk of infectious diseases worldwide it is crucial to develop appropriate analysis methods models and tools to assess and predict the spread of disease and evaluate the risk *Analyzing and Modeling Spatial and Temporal Dynamics of Infectious*

Diseases features mathematical and spatial modeling approaches that integrate applications from various fields such as geo computation and simulation spatial analytics mathematics statistics epidemiology and health policy In addition the book captures the latest advances in the use of geographic information system GIS global positioning system GPS and other location based technologies in the spatial and temporal study of infectious diseases Highlighting the current practices and methodology via various infectious disease studies Analyzing and Modeling Spatial and Temporal Dynamics of Infectious Diseases features Approaches to better use infectious disease data collected from various sources for analysis and modeling purposes Examples of disease spreading dynamics including West Nile virus bird flu Lyme disease pandemic influenza H1N1 and schistosomiasis Modern techniques such as Smartphone use in spatio temporal usage data cloud computing enabled cluster detection and communicable disease geo simulation based on human mobility An overview of different mathematical statistical spatial modeling and geo simulation techniques Analyzing and Modeling Spatial and Temporal Dynamics of Infectious Diseases is an excellent resource for researchers and scientists who use manage or analyze infectious disease data need to learn various traditional and advanced analytical methods and modeling techniques and become aware of different issues and challenges related to infectious disease modeling and simulation The book is also a useful textbook and or supplement for upper undergraduate and graduate level courses in bioinformatics biostatistics public health and policy and epidemiology

Architectural Factors for Infection and Disease Control AnnaMarie Bliss,Dak Kopec,2022-09-05 This edited collection explores disease transmission and the ways that the designed environment has promoted or limited its spread It discusses the many design factors that can be used for infection and disease control through lenses of history public health building technology design and education This book calls on designers to consider the role of the built environment as the primary source of bacterial viral and fungal transfers through fomites ventilation systems and overcrowding and spatial organization Through 19 original contributions it provides an array of perspectives to understand how the designed environment may offer a reprieve from disease The authors build a historical foundation of infection and disease using examples ranging from lazarettos to leprosy centers to show how the ability to control infection and disease has long been a concern for humanity The book goes on to discuss disease propagation putting forth a variety of ideas to control the transmission of pathogens including environmental design strategies pedestrian dynamics and open space Its final chapters serve as a prospective way forward focusing on COVID 19 and the built environment in a post pandemic world Written for students and academics of architecture design and urban planning this book ignites creative action on the ways to design our built environment differently and more holistically Please note that research on COVID 19 has exponentially grown since this volume was written in October 2020 References cited reflect the evolving nature of research studies at that time
